Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

1v16-3m H. C. BENNETT, Secretary.

HANNA'S IMPROVEMENTS IN THE SEWING MACHINE.—Mr. Wm. Hanna exhibits a few very useful improvements which are applicable to all the leading sewing machines, for either fine or coarse work. The first is an adjustable needle-brace, the object of which is to keep the needle on a line with the face of the shuttle race, preventing the dropping of stitches. A bar is fastened to the bottom of the sewing machine, on which there is a spring at right angles, which pushes up the throat, and rests on the end of the throat-plate. This spring acts as a brace to the needle, and at the same time makes a larger loop for the shuttle to pass through, which appears to be a matter of great importance. There is a set screw, which, when turned against the bar, carries the spring toward the shuttle-race, and which will act as a brace to the smallest sized needle. By loosening the screw, the spring will carry the bar back, in order to make space for a larger needle.

Another very useful idea which Mr. Hanna has put into practice, is an arrangement regulating the tautness of the thread in such a manner as to make it accommodate itself more perfectly to the motions of the needle.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

[From the Mechanics' Fair Daily Press, Aug. 15.]

California Trust Company.

Among the many monetary institutions established in San Francisco, probably none are calculated to be of more practical benefit to our citizens than the California Trust Company.

This company commenced business in its new banking office, No. 421 California street, on the first of May last. Its capital stock is one million dollars, divided into ten thousand shares, of one hundred dollars each, and is owned by some two hundred and fifty stockholders.

It will transact business as a bank of deposits and loans, keep current accounts subject to check or draft, make collections and disbursements, and attend to all kinds of financial business on as favorable terms as any bank or bankers. On unemployed capital, term deposits and trust funds, it will allow interest from five to eight per cent. per annum, according to time and amount, from the day of deposit until drawn out. By its act of incorporation and the by-laws of the company, it can loan its money only on good securities, which it is now doing in sums as required by its customers. All its capital, deposits and trust funds, except such as may be required for current demands, will be kept employed in such loans.

One department of this company is devoted to the safe deposit business. It will receive bonds, deeds, stocks, wills, jewelry, silverware, and any valuable property or papers on special deposit for safe keeping in its large, fire and burglar-proof vaults and safes, at moderate charges. In a country where the population changes from place to place so often as ours, this feature of the company, which is new here, will afford great convenience and security to parties.

Another department, is agency and commission business. It will hold powers of attorney, and take charge of the business of non-residents, and persons temporarily absent from the State. It will also act as trustee, receiver, treasurer, etc., in all kinds of fiduciary business. The advantages of employing this company for such business in preference to individuals, are many. It has a large paid up capital in gold, a perpetual existence, a central office, and a good system of records and accounts, showing every transaction with the company.

The officers are: President, Henry L. Davis; Cashier, D. W. C. Thompson; Auditor, Thomas B. Ludlum; Trustees, Henry. H. Haight, John Currey, William H. Sharp, F. L. Castle, J. H. Baird, J. C. Johnson, C. W. Hathaway, H. Barroilhet, A. J. Coghill, J. O. Eldridge, C. J. Decring, D. McLennan, Samnel Crim, W. N. Hawley, M. Rosenbaum, C. W. Plum, H. Rosekrans, H. J. Booth, C. F. McDermot, W. B. Cummings, and H. L. Davis.

NEW ENTRIES.—During Thursday, Friday, and Saturday, there were entered at the Fair, in addition to what has heretofore been mentioned, a concentrator by Kernan, referred to under Mining Machinery in this issue; a miniature artificial stone manufacturing establishment, by E. T. Steen, which turns out specimens on the spot, the principle being the cementation of ordinary sand into sandstone, through the agency of silicate of lime; a handy baby-tender, by S. T. Damon; a boat-detaching apparatus, by N. B. Adams; an improved cover for sauce pans, by George Reuben; a gauging box for beveling barrel-staves, by J. W. Alesworth; a set of puzzles for the edification of that useful class of persons who attend to solving the world's puzzles; an original universal clock, by Heintze; two sets of telegraphic apparatus from the California Business University, which are already set in operation, connecting their place at the middle entrance to the Art Gallery with their institution in town; improved window frames, by Storcken; powder kegs and canisters from the California Powder Works; a variety of edge tools, by Weichart; specimens of California and other polished woods, by Roemer; samples of excelsior sanitary pipe, by Skinner & Flick; a machine for picking hair, which may be seen in operation; house safes, by Chely; piece of sculpture, by Paltenghi; shells, by Day; several fine oil paintings by Sam. Brannan, Barron, Holdredge and others; cabinet furniture of California manufacture, by Wigmore & Palmer; an adjustable carriage pole, by Arnold; a case of California made fuse, by the Pioneer Fuse Company; wood engraving specimens, by Miss A. W. McClellan; more models of schooners and ships; mining hose and nozzles, and a sprinkler, by Tay, etc.

PACIFIC PLATE WORKS,

529 SANSOME STREET,

SPECIALTIES.

PRICE AND GUARANTEE.

The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Bags and Vallses, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of piece goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.

STYLES.

Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.

GOODS MADE TO ORDER.

For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc., made to order at short notice.

COUNTRY ORDERS.

Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

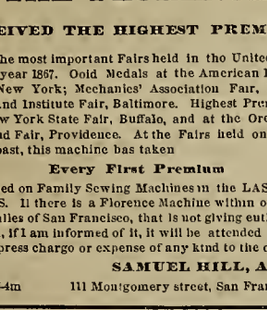
An Ingenious Invention.

Among the many useful articles exhibited at the Fair, there are not many that exhibit more practical ingenuity than the model of the double inclined plane, for hoisting rock, dirt, etc., from mines or excavations. The beauty of the thing is its simplicity. The contrivance consists of an ordinary dumping car, such as are in almost universal use in the mines, the hind wheels of which are six inches further apart than the fore ones. The fore pair run on a tramway eighteen inches lower than that on which the hind ones work. By this simple arrangement the cars always go up or down on a level, thus avoiding the danger of anything falling out of them.



When the car reaches the platform, which is set at a slight incline towards the dump, the hind wheels run up an incline as the lower ones run down, till the load upsets itself by gravitation, when the weight of the empty car being on the hind wheels, draws it down the incline to the platform.

The inventor, who is a working miner, may have never read a line of Euclid in his life; yet he has applied a purely scientific principle to a thoroughly practical purpose. This ingenious and practical device was patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by J. W. Pierce, of Suisun, Solano county.

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOITION.

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloqnenco and Effectiveness of their Composition nnd Manners of Address.

Price, postage paid, - - - - $1.10

This is a new publication, and in style and treatment of this important subject, is orlginal, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "Tho method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. Tho former is necessary to teach the *theory*, the latter the *practice* of the art; and as these are both indispensable to the scho ar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools.

To further illustrate tho varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Swett.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Hermon Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * Exactly calculated to interest. * * It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W Bacle.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times*

Prof. Layres plunges at once "*in medias res.*" He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skilfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together as am. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Macy-ville Appeal.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

PRICE, $1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

A TREATISE

—ON—

CONCENTRATION

OF ALL KINDS OF ORES;

INCLUDING THE

CHLORINATION PROCESS

For Gold-Bearing Sulphurets, Arsenurets, and Gold and Silver Ores Generally.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist, Author of "Nevada and California Processes of Silver and Gold Extraction."

With 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. *The Dressing.*—Dressing of Ores; Principles of Dressing; Division of Dressing

2. *The Separation.*—Separation of Gangne from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. *Cleansing and Sizing Contrivances.*—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.

4. *Rotary Sizers.*—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sitting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. *Reduction of Ores.*—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. *Description of Batteries.*—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.

3. *Details of a Battery.*—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.

4. *Speed, Curve and Order of Lifts.*—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.

5. *The Discharge of Batteries.*—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.

6. *Feeding of Batteries.*—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.

7. *Reduction by Rolling Mills.*—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. *Grinding.*—The Arastra or Tchama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer; Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. *Pans with Plane Mullers.*—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.

10. *Pans with Conical Mullers.*—Hepburn & Peterson's Pan; Belden's Pan; Baux & Guiod's Grinder.

11. *Pans with Tractory-Conical Mullers.*—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. *Pans with Perpendicular Mullers.*—The Centrifugal Ore Grinder; Varney's Quartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.

A. *Concentration of Ore Grains, (Jigging Stuff.)* The Principle; The Jigging.

2. *Movable Jiggers.*—The Movable Jigger.

3.—*Stationary Jiggers.*—Hydraulic Jigger; Petherick's Separator; Stationary Jigger.

4.—*Continual Jiggers.*—Percussion Jigger (Setz Herd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.

5. *Rotary Machines.*—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Auferman's Dry Jigger.

B. *Concentration of Ore Sands and Slimes*

6. *Assorting of Sands.*—The Labyrinth; Borlaee's Slime Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.

7. *Feeding of Concentrator.*—Feeding Boxes; Stationary Feed-Box; Rotating Feeder.

8. *Stationary Concentrators.*—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concave Buddle; Blanket Tables.

9. *Percussion Tables.*—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varney's Percussion Buddle.

10. *Oscillating and Shaking Tables.*—Borlaee's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.

11. *Steady Moving Concentrators.*—Steady Moving Concentrators; Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self Discharging Blankets; Horizontal Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. *Concentration of Gold Ores.*—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.

2. *Concentration of Silver Ores.*—Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.

3. *Concentration of Lead and other Ores.*—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsenicals by Chlorination; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination—Damping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precipitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

PRICE..... $7.50 per copy.

Sent by mail, and sold wholesale and retail, by DEWEY & CO., publishers, office MINING AND SCIENTIFIC PRESS, San Francisco.

SULPHURETS;

What they are;
How Assayed;
How Concentrated;
And How Worked;

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

New Mining Advertisements.

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of August, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary

Any stock upon which said assessment shall remain unpaid on the twenty third day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twelfth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 27 New Merchants' Exchange, California street, San Francisco. au22

Mining Notices—Continued.

Chipiones Mining Company—District of Cres, Sonora, Mexico.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the ninth day of July, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Buzzolini, D.	11	30	$150 00
Buzzolini, D	79	4	20 00
Chevesich, E.	22	1	5 00
Ghirardelli, D.	23	29	145 00
Ghirardelli, D.	72	90	450 00
Ghirardelli, D.	75	20	100 00
Mosheimer, Jos.	56	25	125 00
Mosheimer, Jos.	57	26	130 00
Smith, R.	86	5	25 00
Quin, Thos.	85	5	25 00

And in accordance with law, and an order of the Board of Trustees, made on the ninth day of July, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by John Middleton & Son, No. 310 Montgomery street, San Francisco, California, on Monday, the thirty-first day of August, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. au15

Office of the Folsom Street and Fort Point Railroad and Tunnel Company, southwest corner of Montgomery and California streets, Room No. 16, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of July, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to Caleb T. Fay, Esq., at the office of the Company.

Any shares of stock upon which said assessment shall remain unpaid on the twenty ninth day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourteenth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

au1 JOS. M WOOD, Secretary.

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of July, 1868, an assessment (No. 25) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 533 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Thursday, the tenth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth (5th) day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. au1

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, California.

NOTICE.—The Annual Meeting of the stockholders of the I. X. L. Gold and Silver Mining Company, for the purpose of electing Trustees for the ensuing year, will be held at the office of the Company, Pioneer Hall, Montgomery street, San Francisco, Cal., on THURSDAY, September tenth, 1868, at 2 P. M.

au15 J. CROWNINSHIELD, Secretary.

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco

Any stock upon which said assessment shall remain unpaid on the fourth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. au8

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of August, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, up-stairs, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. au8

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1868, an assessment of thirty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty first day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T B WINGARD, Secretary.

Office, 408 California street, San Francisco. au8

Office of the Silver Sprout Mining Company, San Francisco, August 4th, 1868.

STOCKHOLDER'S NOTICE.—In accordance with a resolution adopted at a meeting of the Board of Trustees of the Silver Sprout Mining Company, held this day, a special meeting of the Company is hereby called, the same to be held at the office of said Company, No. 408 California street, San Francisco, California, on Monday, the thirty-first day of August, 1868, at one o'clock P. M., to take into consideration and decide upon the proposition to increase the capital stock of said company from two hundred and fifty thousand dollars, divided into two hundred and fifty shares of one thousand dollars par value each, the present capital stock of the Company, to three million five hundred thousand dollars, to be divided into five thousand shares of seven hundred dollars par value each.

NATHANIEL PAGE,
A. WINGARD,
E. B. MOTT, JR. } Trustees.

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

3v13f SAN FRANCISCO.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store. No. 125 Clay street, below Davis.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st, San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, deutists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly pulling through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

FRENCH POLISHING DONE TO ORDER.

ENGLISH MINING ENTERPRISE IN TURKEY.—The English, true to their national instinct for the development of leading resources in foreign countries on a methodical basis—of stock companies, which seems to be ingrained in them from the times of John Law and the "Mississippi Bubble"—are, of course, the proprietors and workers of the coal mines in Turkey, if they are worth anything; and such appears to be the fact. The Heraklea coal basin attracted attention during the Crimean war; extending forty miles along the coast, and requiring scarcely any land carriage, while the seams are found cropping out to forty feet in thickness.

SQUARZA'S PUNCHES

—AT THE—

MECHANICS' INSTITUTE FAIR.

CHALLENGE

To all Punch Manufacturers

IN THIS STATE FOR

ONE THOUSAND DOLLARS

That the Punches manufactured by the undersigned are of better material, better made, and of superior flavor to any Punches that are fabricated on this coast

The Punches of Squarza are world-renowned, and have been distinguished by receiving THIRTEEN PREMIUMS at the different Fairs in this State. The following is a list of the Celebrated and Favorite.

Squarza's Punches and Cordials

which will be on exhibition at the Mechanics' Institute Fair, where visitors from the interior can try the various brands:

Welcome,	Strawberry,	Mint,
Jamaica Rum,	Pisco,	Anise,
Cognac,	Appetizer,	Blackberries,
Arrack,	Anti-Dyspeptic,	Rose,
Kirschwasser,	Roman,	Kimmel,
Gin,	Nectar,	Pin Coffee,
Whisky,	Ladies' Tears,	Kirsch
Cocoa,	Anti-Divorce,	Ladies' Pleasure,
Coffee,	Aurora,	Morning Comfort,
Tea,	Farewell.	
	Pine Apple,	

In addition to the above well known beverages, the undersigned has the pleasure of introducing for the first time

THE EGG NOG PUNCH,

A drink with all the flavor and invigorating qualities of this popular decoction, which can be bottled and kept like any other Punch. Also the

LADIES' FAVORITE,

A mild and highly-flavored Cordial for the Ladies; both of which are preparations by Squarza

There will also be on exhibition the celebrated brands of Bitters made by Squarza—the

Hygienic Bitters, Cholera Antidote, Aguasturo, Selsner.

All these liqueurs have ripened and mellowed with age, having been manufactured from five to seven years ago by Squarza himself.

A. BONA,

Successor to V. Squarza,

National Manufactory, 120 Leidesdorff street, Bet. Sacramento and California, opp. What Cheer House.

THE INFLUENCE OF THE FAIR.—Those who visit the Fair for the mere gratification of seeing the sights, and of being seen themselves, have no conception of the influence it exercises. The more thoughtful visitor, particularly those who have attended the previous Fairs of the Institute, must feel gratified by observing the many signs of the influence of such an exhibition. The display of the various products of local industry, the evidence of the progress of local manufactures,—such as the present Fair affords,—is of itself a sight that must gratify every well-wisher of the State. But a deeper, more significant influence works through such exhibitions. The man or woman who *thinks*, will mark this influence, in the models of machinery made by apprentices; drawings made by the children attending the public schools, as well as in the countless articles on exhibition, made by the tiny fingers of ingenious, ambitious children generally. There is no department of art or industry but what is pervaded by this influence. To stand for an hour in the vicinity of the organs and pianos, and hear little girls and boys, scarcely tall enough to reach the key-boards of the instruments, execute the most difficult solos with absolute brilliancy, affords a proof that, even in this dollar-loving community, the refinement of music is as much cultivated as the mechanical arts. So long as ambition,—the desire to excel,—pervades human nature, the means for exciting such ambition will be beneficial. From this point of view, the influence of mechanic's fairs is only second to that of the public schools. The latter lays the foundation of knowledge, the former fashions the superstructure raised on that broad foundation.

SHEET IRON CHIMNEYS. — Minneapolis, Minn., has produced a sheet iron chimney which is made of three sheet iron cylinders, the space between the outer and second one being filled with ashes, thus securing safety from fire. It is lighter and safer than brick.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Ships, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are required, not exceeding twelve.

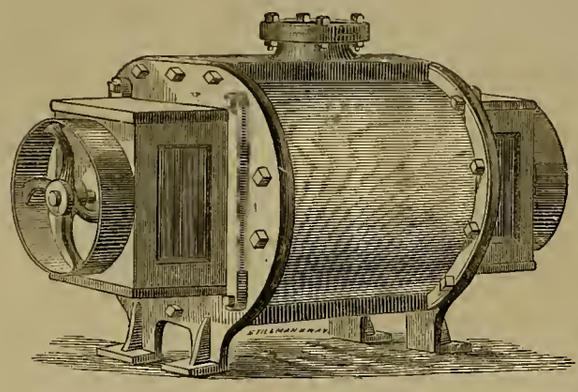
THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these Instruments without authority from me will be dealt with according to law.

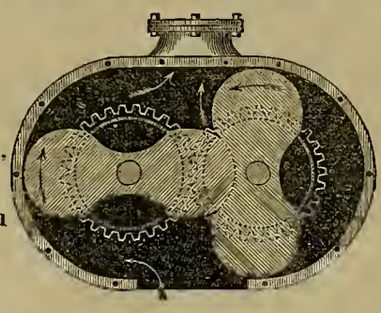
N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address



J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16 6m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

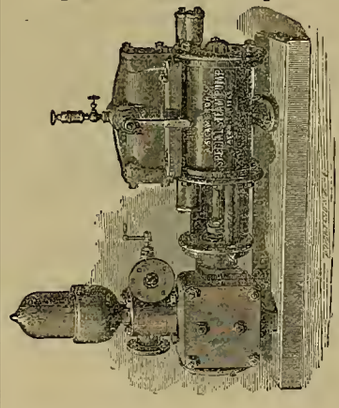
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.



CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

And Cocoanut Fiber for Upholstery,

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to palm, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

SHUBRICKVILLE.—Five photographic pictures of pencil drawings, by Gustavus Jansen, have been placed into the Art Gallery, illustrating the remarkable engineering feat of saving the revenue cutter Shubrick by taking her off the rocks overland, repairing and launching her again. No. 1 shows how she struck; No. 2 how she was broken like a stick in the middle; No. 3 how she looked after she was straightened again to her original shape, and transported 1,500 feet; No. 4 after being "slewed" around on the rocks, and lowered 18 feet in a position to be launched; and No. 5 on her way rejoicing to Mare Island Navy Yard, in tow of the brave steam tug, Mary Ann, whose exploits on the Humboldt Bay bar, and of themselves furnish matter for a little chapter of nautical heroism, as everybody knows who has ever gone sailing with the lumbermen up the coast.

One apparently insurmountable difficulty was encountered by the engineer, Mr. Winsbip—who helped build the Shubrick in Philadelphia 14 years ago, and has been with her ever since—in the shape of several enormous rocks in the hold of the vessel, which could not be gotten out in any manner imaginable. The idea struck him that they could be blasted out—and that is what was done. If the visitor would like to form an idea of how man's power can triumph over even the immensity of matter comparatively, a glance at the pictures will be profitable.

FROM SAN JOSE.—A large box of "bouncing big" Bartlett pears, and another of Dumas purple plums, came to us from San José, on Wednesday. They are the finest we have seen, or eaten, and deserve a 1st premium. Don't know who "grew them" for us. Just like our banking friend, to slyly send them "express paid"—so we will get even by telling everybody how the modest fellow got caned out of the City Council, after seven years' service, by his associates—with a nice gold beader—of which he is no doubt very proud.

WARD'S SHIRTS.—Who has not heard of them, who has not worn them, and who ever found a fault in them? They are the most perfect of all "perfect fitting" shirts, and are manufactured from the best of muslin in the most workman like manner. They fit the form with elegance and comfort. An eccentric printer was once heard to say they were the only "fits" ever known in some families.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

PLAN OF THE PAVILION.

By this Plan we aim simply to sectionize the space in the Pavilion, so that exhibitors can determine in which section their articles are located, and by naming to others the number of that section, they are thereby directed to the vicinity of the article exhibited, and by inquiry can readily find it. A few of the most conspicuous articles are noted on the Plan, to serve as "guide marks" for the locality in which they are situated.

THE GERM OF A GREAT TRADE.—The majority of those who examine the interesting collection of silkworm cocoons, and raw silks exhibited by Mr. Prevost, scarcely comprehend the import of that curious collection. In fact, it is difficult for the most comprehensive minds to grasp the whole idea the subject suggests. Those who have studied the causes of the advancement of manufactures in different countries, and consequently are aware from what insignificant beginnings the greatest industrial interests of foreign countries sprang, can perceive how important the silk product of California is destined to become. But how few there are among the crowd who gaze on the collection of silkworms' eggs, which appear like grains of sand on the floor of the case which contains them, that comprehend the fact, that these little grains exercise almost as great an influence over the commerce and manufacturing industry of an important portion of the world, as gold itself! The latest news from Japan afford a striking illustration of this fact. That country is disheartened to such an extent by the contentions of rival factions, that it is unsafe for foreigners to leave the seashore. But such is the demand for silkworms' eggs, that dealers in that article penetrate far into the interior to procure them. So extensive is this trade, that the money paid for the eggs has deranged the course of exchange between that country and China, and Europe. The enormous sum of $5,000,000 was paid for them during the two months previous to our latest dates.

The demand for them in this State is rapidly increasing. Silkworms' eggs already form an article of export from California. Such of us as shall be alive in 1878, will see an extensive trade in progress—the result of the germ on exhibition at the present Fair.

APPOINTMENT OF COMMITTEES TO AWARD PREMIUMS.—In order that the fullest satisfaction may be given to all concerned in the matter of premiums, the Board of Managers of the Fair have determined in favor of the election of the judges by ballot, by the exhibitors themselves, at meetings of the several classes of exhibitors, which are to be called from time to time, for that purpose. Such election is to be held under regulations adopted by the Board of Managers, and to be subject to the ratification of the Board of the Institute; the object being that there shall be no wire-pulling whatever, in connection with the matter, and that nobody shall be put into office who is interested.

One of the leading committees has just been appointed in this manner, viz., the Committee on Steam Engines, which consists of Messrs. Wm. Burnett, Supervisory U. S. Inspector of Boilers for the Pacific Coast, Montgomery Fletcher, Chief Engineer of the Mare Island Navy Yard, and C. C. Bemis, Deputy U. S. Inspector of Boilers.

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition; the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

Collins' Rock-Breaker.

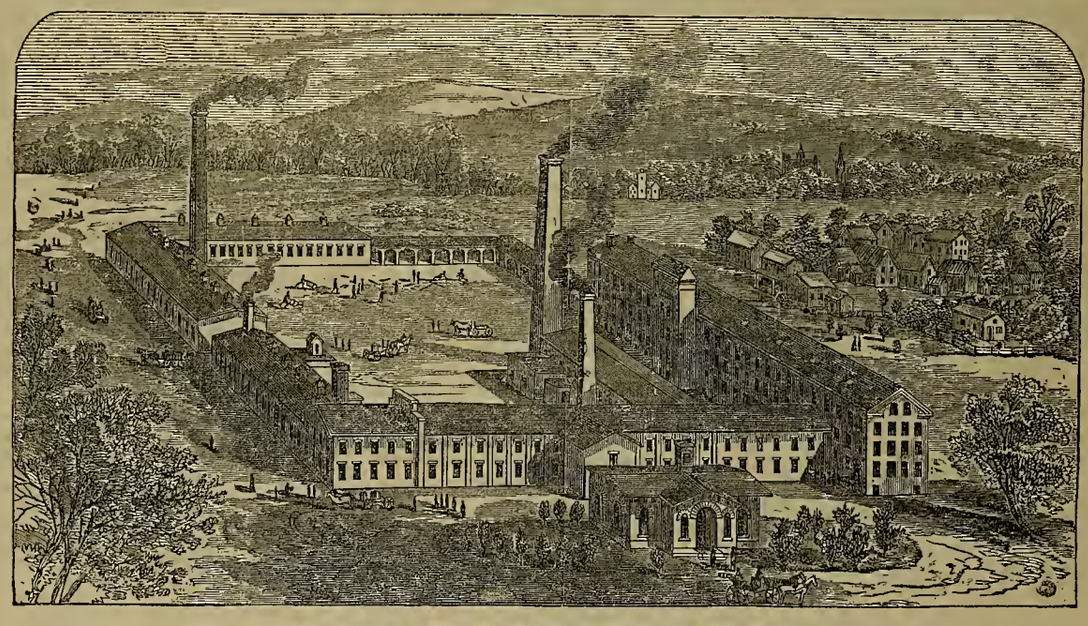
A new thing in the way of a quartz crusher is the "Oscillating Lithotrihon" of Col. John A. Collins, of Virginia City, the model of which was taken out of its box on Wednesday. The idea is quite original, but it resembles, in principle, the Chili mill more than anything else. A large wheel of massive iron 10 feet in diameter, runs in a trough, like the stamp trough, but not round a center as in the Chili mill; it is a straight trough, and the wheel is moved backward and forward by the crank of an engine, with a rod connection. In order that great pressure may be brought to bear, the wheel is confined above by rollers, being held down by a strong frame and by rubber cushioning behind the rollers. Thus far it is all very simple, and the comparative value of the plan in practice beside the stamp mill, or the well known double iron rollers for crushing, is only a matter of economy as to construction and operation, which is to be determined in no other way to the satisfaction of miners and mining engineers, than by trial. Probably it will find itself in more immediate competition with the double rollers, over which it would have the advantage of crushing as finely as may be desirable, either wet or dry, and with or without quicksilver. A meeting of millmen at Virginia City is said to have given a favorable decision in regard to the machine, and the Superintendent of the Nevada mill has advised its substitution for the stamps in use there; so that it is probable a test will be made as to its merits economically. The great advantage claimed by the inventor is the small amount of power required to drive the wheel in its oscillatory motion, and to accomplish a larger amount of work than could be done by stamping. While the machine is adapted to the finest crushing, it is also claimed to be equally suited to the breaking and reducing of pieces of rock up to twenty inches in diameter. Col. Collins is expected in town in a few days, when his model will be put to a working test. The feeding machinery of the model, though not an essential part of the machine, is a little complicated, and requires the inventor's personal attention in order to make some repairs, before it can be safely submitted to the severities of rock-breaking.

A. ROMAN & Co., whose enterprise in publishiug California works, has given extensive encouragement and employment to native literary talent, are, we believe, reaping a fair reward in the sale of their works. For want of an engagement here, some of our best writers have been compelled to seek a wider and more profitable field of action, and others have been forced into other employments. The success of the *Overland Monthly*, and the occasional publication of meritorious books of a local character, will do much to strengthen and develop a high order of talent among us. Those who want books at wholesale or retail, should bear in mind that this is exclusively a book house.

CLOSE OF THE FAIR.—It has been stated, unofficially, however, that the Mechanics' Fair will close Sept. 8th. Owing to the opening of other Fairs in the State, the exhibition cannot be extended beyond the 12th, no matter how encouraging may be the attendance and receipts.

The Florence Sewing Machine Works.

We give horewith an illustration of the manufacturing establishment of the celebrated Florence Sewing Machines, which is situated in the village of Florence, a place of recent growth, about three miles from Northampton, Mass. The illustration represents the buildings as they will appear when finished; although the entire structure has not yet been completed. The buildings occupy some two or three acres of ground, and the entire manufacture of these celebrated machines is carried on here. A recent visit to this establishment enables us to speak advisedly when we say that a traveler seldom meets with a more perfect system of labor-saving machinery, or a more completo and economical detail of general arrangements, than is seen at this establishment.



In brisk times, from 250 to 300 men are employed, turning out from 1,000 to 1,200 perfect machines per month. The company provides all the materials and permanent tools used, but a large proportion of the labor is contracted for, by departments, and paid for by the piece, upon its being inspected and accepted by the company's superintendents and experts. By this method many hands and brains are working for self-interest in perfecting machinery and new devices for improving and expediting the work. Such a system of labor-saving machinery (which adds to the perfect uniformity of all the fine and small parts,) is rarely to be found. The best of material is used in the construction of the working parts of every machine, and no piece is accepted, unless upon close examination it stands a perfect test.

The company's outlay, in order to manufacture perfect machinery economically, has certainly been immense; but their success seems to have more than justified the liberal outlay.

The "Vincent Binder," a California invention, is made here; special machinery having lately been prepared for its manufacture on an extensive scale. It is attached to the Florence machine, and is said to be in good favor. Mr. Vincent is an old resident of Stockton, in this State. The Florence machine is decidedly novel and ingenious in construction; in which character it is protected by twelve patents.

When there we had the pleasure of meeting several officers and shareholders of the company, gentlemen of straight-forward business qualifications—like their excellent San Francisco agent, Mr. Samuel Hill, a native and former highly esteemed citizen of Northampton.

In referring to the illustration, the cottage immediately in front of the main structure is the company's office. A portion of the village of Florence, which owes its growth in a large measure to the grand success of this establishment, is seen upon the extreme right. Just across the plain in the rear and to the right of the works, may be seen the silk factories, several of which are established in this locality for the manufacture of sewing silks. In the far distance may be seen a range of mountains, prominent among which is Mount Tom, one of the highest and most noted mountain elevations in New England.

THE FLORENCE SEWING MACHINE FACTORY, AT FLORENCE, MASS.

Although but recently introduced on this coast, the sales in the past year of the machines have exceeded, by nearly $20,000, those of any other sewing machine, as shown by the sworn statements of the different agents at the Internal Revenue Office.

These immense sales, and the rapid advance of this machine in public favor, especially in view of the fierce competition existing in this branch of trade, attest the genuine merit of the Florence machine.

We are not disposed to over-commend anything placed before the public for its suffrage; but from personal knowledge of the Florence machines, from a careful inspection of its operation in the hands of many of our friends, we have no hesitation in pronouncing them inferior to none, to say nothing of their many decided advantages.

While a large number of sewing machines have been offered to the public, some of which possess points of excellence and acknowledged merit, the necessity of a machine, more perfect in its mechanical construction, has long been felt—a machine combining in the highest degree, *simplicity* with *durability*; and one which, while capable of doing a *greater range of work*, could be easily understood and comprehended by all.

To supply a machine, free from the objections attached to others, has been no easy task. By a liberal expenditure of capital and the patient, untiring labor of years, this is boldly claimed to have been accomplished by the Florence Sewing Machine Company.

Discarding the chain and loop or knit stitches, this company adopts the lock stitch (alike on both sides of the fabric), which is regarded by many as best suited to all kinds of work. They also add the knot stitch, which is said to be *stronger and more elastic* than the lock; thus enabling the operator to select a stitch perfectly suited to every grade of fabric, and when necessary, to sew seams much stronger than it is possible to do by hand.

It has a *reversible feed motion*, which enables the operator, by simply turning a thumb-screw, to have the work run either to the right or left; to stay any part of a seam, or fasten the ends of the seam without stopping the machine or turning the fabric. It runs lightly and sews rapidly; it does the heaviest or lightest work *without change of tension or machinery*. This, in our opinion, is one of its most useful features.

For want of space, we cannot speak further of the many and peculiar advantages of this new machine. All will be well repaid, even if they do not wish to purchase, by examining the beautiful working of the Florence, either at the Pavilion, or at the salesroom, 111 Montgomery street.

NEW ENTRIES.—Nine or ten new articles are still coming in every day, and many of them are either interesting or important. E. E. Winchell has brought in a Rohrer's portable blacksmith's forge, weighing 160 pounds, and measuring, when closed up, 20x31 inches. Besides which there may be mentioned a new kind of quartz mill by V. Smith, an amalgamator by Dewey & Co., a new churn by J. N. Seely, etc.

Our Industrial Fair.

[From the Mechanics' Fair Daily Press.]

General Review of the Exhibition.

CLASS IX.

Glass, Pottery, and Clay Ware.

The Pacific Glass Works, Bennett & Co., whose factory is at the corner of Iowa and Mariposa streets at the Potrero, make a fine exhibition of all the more useful articles which are demanded by the trade on this coast. They are chiefly of the common bottle-green color, which is given to the glass by an infinitesimal quantity of the protoxide of iron, incidentally intermixed. Every variety of ordinarily useful bottle may be seen, besides an assortment of willow-cased demijohns, carboys, etc., all of which may also be seen at John Taylor & Co.'s, the agents, No. 514 Washington street. These are the only glass works in operation at the present time on the Pacific coast.

The San Francisco Glass Works were destroyed by fire some time ago, notwithstanding which they are represented by a very fine display at the Fair, including everything that is made at ordinary glass factories, useful as well as ornamental and astouishing. There are bottles of all sizes and colors, cups for ordinary and chemical uses, a speaking trumpet, rods, tubes, canes, flag-poles, stoppers, vases, balls, bollow globes for lamps, carboys, ship-lights, ink bottles, vials, etc.; in short all kinds of flint, German flint, and green and black glass ware. The chimney of the late works may be seen standing on Townsend street, between Third and Fourth. We are pleased to learn that these works are to be rebuilt speedily. The proprietor, Carlton Newman, has been struggling energetically for the establishment of a creditable industry, and is deserving of encouragement and support.

Glass-cutting on plain, colored and ground glass, is represented, by Thomas O'Neill, and by John Mallon, who execute all kinds of lettering and ornamental work, desirable for signs, doors, sky-lights, church windows, domes, etc.

Mirrors of the richest quality and appearance may be seen in the art gallery, placed there by Whittman, Fuller & Co., at the southern end, with very tasteful plain frames, and by Jones & Wooll at the northern end, with gilded frames.

Robert Mills also has some beautiful mirrors to the left of the fountain, and some artistic colored glass paintings, for church windows and the like, which may be observed in the windows above the gallery at the western end of the Pavilion, viz: "Christ on the Cross," a horse, a little shepherdess, a dove, and some ornamental designs.

Sign-painting on glass is represented by N. V. Gallagher, J. W. Cherry and Sweett & Gadsby.

Fine imported porcelain and glassware, statuary, etc., are exhibited by R. A. Swain, and by Haynes & Lawton. The beautiful glass cases of these firms, and the contents thereof, display more of the luxurious tastefulness of opulence than anything else in the exhibition. The former show imported crockery, glassware, white and decorated China, looking glasses, goblets, statuary, etc.; the latter make table articles and silver plate more of a specialty.

One of the most interesting exhibitions in any department, is that of Issac Lohree & Co., representing the Golden State Pottery Works at Antioch, Contra Costa County, the trade depot of which is at No. 516 Commercial street. It comprises a very creditable showing of almost all varieties of stoneware, earthenware, Rockingham ware, flower-pots, water and drain pipes, yellow ware, stove linings, fire-brick, fire tile, retorts, tanks, tubs, etc., entirely of home manufacture, and offered to the trade at 25 per cent. cheaper than the imported ware. We noticed also churns, water-filters, drain pipes, beer bottles, hacks and cheeks for mantels made of stone ware; also pitchers and spittoons made of Rockingham ware.

The material is procured mainly in the vicinity of the works in Contra Costa County. Many of the articles are ornamented with artistic bas reliefs of figures and flowers.

The pottery works at the Mission have been discontinued, so that this is now the only extensive enterprise of the kind in operation in the State.

Water and drain pipes made of asphaltum cement, are exhibited by Egan Brothers, and Wise & Robinson. The same material as applied to roofing and paving, is exhibited in models.

The Benicia Cement Works have a large number of kegs of their commercial article, together with specimens of the cement after it has become fixed. The capacity of the works is 300 barrels a day.

Brick is not represented at all. An opportunity to test and compare the productions of different localities, which are competing in the supply of the San Francisco market, ought to have been afforded to the numerous lot-holders and expectant builders who visit the Fair, and the result could not have been otherwise than beneficial to the manufacturers of the best article.

Allied natural productions, which belong to different classes, are the "electro silicon," or "magic brilliant," intended for family polishing, a kind of fine chalk, which is exhibited amongst the articles of table ware without name or locality of production; and the mineral or rock paints of O. A. Olmstead, from Olmstead's Mills, in Sonoma county, of which there are twelve varieties of color.

CLASS X.

Wood and Wood Work.

Owing to increased pressure both for time and space we shall be restricted to a "mere mention" of many important articles, which may be taken up, however, and treated separately hereafter.

Elam & Howes exhibit buckets, tubs, hoxes, kegs, wash-boards, refrigerators, butter kits, churne, washing machines, strawherry baskets, broom and pail bandles, potato mashers, towel and bread rollers, etc; all of their own manufacture.

Geo. L. Wenzel exhibits specimens of California oak from Clear Lake, and some coopering of that material, which has the advantage of never being worm eaten. Oak is very plentiful in the section named, the trees growing from 3 to 6½ feet in diameter, and 40 to 80 feet in hight.

Brush and broom manufactures are exhibited by the San Francisco Brush Factory, G. M. Zan, and by the California Brush Factory, each varying a little from the other in their specialty.

Edward Galpen also exhibits wooden ware, similar to Elam & Howes'.

Shingles are turned out every evening by F. A. Huntington's shingle making machine, at the rate, when worked up to time, of 3,000 an hour. This machine was built by Geo. T. Pracy, at 109 Mission street, and deserves further notice at a future time.

Splendid specimens of California laurel may be seen in the Music Room, representing the establishment of John D. Boyd, equal in effect to the finest productions of tropical forests.

Specimens of graining, imitation mosaic and inlaid work, are shown by Boyd, Geo. A. Brush, C. Roemer and Wm. O'Day. Roemer shows a beautiful pillar made out of different ornamental woods. J. Rolland sbows samples of inlaid floors.

A hand-organ of fine inlaid work, made in Europe, is labelled "In commemoration of the Hayes & Higgins election bet, Sept. 11, 1867." But the most elaborate specimen of inlaid work is the Japanese cabinet in the music room, without label.

The Pacific Barrel Company, Fliut, Peabody & Co., exhibit machine-made staves and barrels of pine wood grown in California. Their factory is at the Potrero.

Fulda & Son make a fine exhibition in wine cooperage. They have three very large tuns, two of them for R. Snyder, of Sonoma county. An oval one, made to fit into a recess in Mr. Snyder's cellar, contains 890 gallons, and cost 18 cents per gallon, or $160 20.

Sturger's improved weather-proof window frame has the sash grooved and running on a raised strip in the frame. The wind and weather proof results aimed at are effectively attained in a simple manner.

Lasts are exhibited by Shephard & Carroll, and Peter H. Fluck, of the natural form of the foot.

A stave-jointer and gauging machine are exhibited by J. W. Alesworth, of Santa Cruz, which have already been noticed.

Washing machines are on hand in numbers. There is the Dixie, a simple lever arrangement which rubs and rolls; the Rasmussen, similar to the Dixie in principle, but double and more complicated; the Pioneer Washer, an oscillating rotary machine, being simply a contrivance by which four tusks are made to reach down into the tub, and to rotate the clothing first one way and then the other; the Wolverine, a kind of mill in which the clothing is made to pass between revolving rollers; the Patterson Combined Washer and Wringer, exhibited by Miss A. W. McClellan, in which the clothing lies on a ribbed bottom and is rolled over by a large ribbed roller weighing sixty pounds; and the Vail machine, for blankets and similar heavy articles, which looks like, and is nothing but a small wooden stamp mill, in which the article is pounded in soap suds until it is clean.

School furniture of a substantial character, with iron under-pinning, is exhibited from Warren Holt's Pacific School Institute.

In general furniture, Johnson & Best show a splendid black walnut hook-case, and other office furniture; Bryant & Strahan, a magnificent side-board, with carved birds of very artistic execution; Wigmore & Palmer, a variety of school-room, office and library furniture, of very superior execution, amongst which the Pompeiian Secretary, in imitation of designs from the buried city, is especially worthy of examination; N. P. Cole, a variety of California rosewood and laurel, and some black walnut pieces; Goodwin & Co., fine rosewood furniture and chairs; Huntington & Co., bedding with rubber springs.

Hat and wig blocks are exhibited by Gifford & Linsley.

Outside there is a gigantic pine stern knee from Stillighomish Slough, W. T., cut for the California Steam Navigation Co., which is 17 feet long, and has a throat of 4 feet 6 inches; a pine log, sawed at Port Ludlow, W. T., 28 by 32 inches in dimensions, 48 feet long, and containing 3,580 feet of lumber, having been cut for the San Marcial Silver Mining Company; and a log of California laurel, cut by L. E. Thayer, 2½ feet square and 50 feet long.

Snow & Roos exhibit picture frames; G. A. British shows walnut doors with oak casing; Feldman & Co., and Thurnaur & Zinn, willow ware; and P. Gibot, spiral stairs.

CLASS XI.

Minerals.

Kustel's collection is the leading feature of the exhibition in this department. It is a very complete methodical collection, comprising crystallized and characteristic specimens of all the commonly found species, and especially of the leading gold, silver, copper, lead and iron ores. It is just such a collection as everybody must have access to that desires to become familiarized in any degree with minerology. The labor and careful attention of years is usually necessary for the collection of a cabinet of this character and quality of specimens. More showy cabinets can be seen in any mining camp; but the difference is very easily discerned by all who have learned to distinguish pyrites from gold, or zinc blende from the sulpburet of silver.

Specimens of meerschaum and amber, in their raw state, may be seen in the show-case of Charles Kohlman, pipe manufacturer.

There are three cases of lava specimens from Mauna Loa, in the Sandwich Islands, taken from the lava streams of the recent eruption.

Copper ores, embracing carbonates, sulphates, silicates, the red oxide and native copper, are exhibited from the Planet mine of William's Fork, Arizona; some of them assaying 50, and even 60 per cent. of copper.

The North Star gold mine of Grass Valley exhibits a splendid lot of specimens, some of them of very large size, which are valuable as showing stratification in veins, and thereby disproving the possibility of volcanic ejection, in the filling up of those veins with quartz, pyrites and gold. A box of cleaned pyrites, washed in Hendy's Concentrator, has just been added to the mining department.

Copper and silver ores are also exhibited from the Morning Star gold and silver mine of Mogul, Alpine County.

CLASS XII.

Chemistry and Chemical Substances.

Chemical manufacturing, though quite in its infancy on the Pacific coast, is already entered upon by competing firms, which display considerable energy within the limited field opened to them by the demands of the market. They are very poorly represented at the Exhibition, for some reason or other; possibly because they may not care to have each other's productions canvassed and compared.

Crane & Brigham exhibit crystallized sulphate of copper, or blue vitriol, of which hundreds of tons are used annually to preserve wheat from smut. It is made from low grade copper ores. The works are at Hunter's Point.

The San Francisco Chemical Works, Falkenau & Hanks, exhibit some large crystals of sal soda—carbonate of soda—which is made of common salt from sulphuric acid, and subsequent decomposition of the sulphate of soda so obtained by means of sawdust and lime, changing the sulphate into carbonate. Nitric, sulphuric and muriatic acids, besides other chemicals, are made by this firm, but are not exhibited. The works are on Sixteenth street, between Folsom and Harrison.

The Golden City Chemical Works are not represented.

J. B. Parsons & Co. exhibit Bowman's American washing compound; Boyd's yeast powders are represented by numerous packages; the "giant powder" proclaims its own qualities, by the effects which were produced by half an ounce of it upon an iron shell, and by its utter harmlessness to a box, filled with it, which was thrown into the air. Tuck, Horstman & Co. exhibit crystals of sal soda; Charles Bernard exhibits, amongst other things, cream of tartar—hi-tartrate of potash, being the sediment which deposits itself in wine casks—and saleratus, or prepared pearlash; Dr. Tolman shows some "California seidlitz powders," which are made from materials expressly for the California trade; Eberhart & Lachman, wine dealers, have on exhibition a fine photograph of the Napa soda springs; Donnolly & Co. exhibit their premium yeast powders, composed chiefly of saleratus; also some saleratus, and cream of tartar.

Salt is exhibited by numerous firms, and from localities both far and near. The Union Pacific Salt Company have some from Turk's Island, and from San Quentin and Plummer's salt works at San José Mission; also some Pembroke table salt, and pork packing salt.

B. F. Barton, of the Pioneer Salt Works, exhibits English salt, two carbonates of soda, and cream of tartar.

Holliday & Brenham exhibit Carmen Island salt, of which substance, as a curiosity, there is a crystallized cross, etc.

Perfumery and toilet articles are exhibited in considerable quantity and variety, with fine effect, by J. W. Angel, apothecary.

CLASS XIII.

Jewelery, Silver and Plated Ware, Etc.

Braverman & Levy have two large cases full of the finest specimens of gold and silver ware. Art has been called into requisition in the execution of some exquisitely beautiful designs, in polished and rough silver. There are salvers, knives and forks, goblets, drinking cups, pitchers, cases of spoons, bells, etc., exhibiting a great fertility of richness and luxury.

Bronze aluminum, an alloy which can scarcely be distinguished from gold, consisting mainly of copper and aluminum, is represented in a case of articles of jewelry from the shop of J. Levy. The metal is light and flexible, hard as steel, and will not rust. Table articles, spoons, watches, match safes, ear-rings, bridle buckles, spurs, etc., comprise the principal subjects of its application.

Carl H. Hain exhibits an astronomical clock, showing the time of a dozen of the leading cities of the globe, by means of an equal number of dials surrounding the main dial; also some very tasteful wall clocks, with black walnut finishing; and the Howard and Elgin watches with their works exposed to view; besides miscellaneous jewelry, as pitchers, goblets, spoons, napkin rings, and the like, of California manufacture.

Vanderslice exhibits a fine array of solid silver ware of California manufacture, consisting of plates and other table articles, spoons, forks, etc.

John Martell exhibits specimens of silver plating; and D. Josepb, of engraving on plate, including door-plates and bell-pulls. Price's silver-plated cutlery comes under the same bead. E. G. Dennison, of the San Francisco Plating Works, shows a variety of plated ware, which cannot be distinguished from the solid article. Oakley & Rosekrans exhibit plated door-plates, bells, numbers, and other plated ware for houses and ships.

The case of Haynes & Lawton contains some of the finest specimens of plated ware, which is made a specialty of by them, as agents for the Pacific Plate Works.

The large clock on the front gallery which gives time for the Exhibition, was manufactured by H. Wenzel. Its works can be inspected through glass.

An ingenious watch alarm by Theodore Hollander, by which any ordinary watch may be made to give an alarm, can be seen in the Art Gallery.

F. Heiuze exhibits dials for watches and clocks.

Swords, shoulder-starps, epaulettes, and other military and naval paraphernalia, principally of gold or gold plated, are exhibited by T. Rodgers Johnson, and by Blake & Co.

Galvano plastics are well represented by a case of successfully executed copies of some of the finest bas reliefs and figures produced by first class artists of this or any other country—placed there by R. Rocchioli, silver plater and engraver. Many of the articles are of gold or gold plated. Persons who love to see artistic things worked out in gold or silver, will find very much to gratify them in Mr. Rocchioli's exhibition. There are besides numerous very natural and perfect figures and faces, some tasteful candelabrias, and a large piece of plate containing the Constitution, with bas reliefs of Washington, Webster and Clay.

CLASS XIV.

Printing, Engraving, Lithography, Book-Binding and Paper-Making.

Under printing there is little to be described. A noteworthy article, of historical importance, is the first printing-press manufactured on this coast, by Palmer, Knox & Co., for Faulkner & Co., which may be seen in the machine department. It is an improved Washington press, with a flat knuckle, and rubber instead of steel coil springs.

The only additional printing press to be seen in the Pavilion, is that on which the FAIR PRESS is struck off nightly, by Dewey & Co., of the MINING AND SCIENTIFIC PRESS.

The type foundry of Faulkner & Co. is an interesting thing to examine. Type are cast with such rapidity that it requires close attention to see how it is done. Specimens of the type manufactured by Faulkner & Co. are also exhibited.

Paper manufacturing is carried on by two busy establishments—the San Lorenzo Mills and the Pioneer Mills, for both of which S. ". Taylor is the agent. The article produced is chiefly wrapping paper of various colors and degrees of fineness, made of straw. There are large stacks on exhibition from both mills.

In stationery and blank books, John G. Hodge & Co., Geo. B. Hitchcock and Wm. B. Cooke are represented. Hodge has a fine case full of blank books, gold pens, rulers, tacks, chess boards, bill-heads, paper, portfolios, cash boxes, letter presses, stamping presses, branding irons, etc.

Hitchcock occupies considerable space very creditably to his establishment, in the rear gallery. Everything exhibited by him is of superb quality. The large letter presses are of California manufacture, and the wooden cabinets on which they stand are of California laurel. Stately ledgers, with beautiful and very substantial binding, and a great variety of other blank books, may be seen in his case.

Cooke makes a fine display of similar articles, including cash boxes, etc. His wholesale price list is hung up for examination, and a small pamphlet catalogue of goods may be had on application.

Sumner Whitney & Co., publishers and importers of law books, exhibit a case containing volumes of nicely bound California Reports and Digests, and a pocket edition of the Civil Practice Act.

H. H. Bancroft & Co. have on exhibition a case containing all their own publications, making a very instructive and appropriate subject for examination by the visitor. One is favorably struck with the number of large and costly publications which have been given to the public of California by that enterprising house—such as Hittell's and Labatt's Digests, Tuthill's History of California, Cronise's Natural Wealth of the State, Ross Browne's Resources, besides numerous form-books, minor publications, and maps.

H. C. Bateman exhibits some splendidly bound imported books.

Valuable and interesting specimens of the typographical art are exhibed by Cuhery & Co., book and job printers, viz: A portrait of Guttenberg, the inventor of printing, made of movable type, consisting entirely of light and heavy dots, having required two years of some patient German's life to execute it; a similar engraving, representing a bird and some flowers, over water; and a scrap book, filled with specimens of excellent ordinary printing.

The engravings of California production are: Gifford's Birdseye View of the City and County of San Francisco, executed by W. Vallence Gray, and of very natural effect at a little distance, overlooking the peninsula from the direction of Mount Diablo, and vanishing in the ocean line; Goddard's Birdseye View of the same, looked at from the ocean, embracing the topography of the entire country surrounding the bay, and looking beyond into Sacramento Valley, and as far as the Sierra Nevada, the publishers being Snow & Roos, and the lithographers Britton & Rey; the diplomas issued by various societies and institutions, as the Mechanics' Institute, State Agricultural Society, Pacific Business College, etc.; several frames of beautifully executed monograms, crests and cards, by H. Payot; a fine lithograph of the American Exchange Hotel, with portraits of B. and T. Sargent, by Baker; a frame of wood engravings, executed in the best style of the xylographic art, by Miss A. W. McClelland, a pupil of the Cooper Institute School of Design; and several very fine English steel engravings, by Snow & Roos, viz: The Railway Station, and the Intellect and Valor of Great Britain; besides which there are some very perfect French and German chromo lithographs.

Penmanship is well represented. The finest is that of F. Scregni, of the Pacific Business College. There is a copy of the Constitution, by J. L. Fields, of the Pacific Business College; St. George and the Dragon, by the same; the Declaration of Independence, by E. P. Heald; a large frame of very fine ornamental lettering, by L. M. Fernandez; the Emancipation Proclamation, by Mrs. R. A. Hopkins; specimens of Speuccrian penmanship, and several well executed hands, a scroll, and a horse, etc., by Pedro A. Espina, of San José; ornamental cards, by Waller Wallace; a portrait of Lincoln, by E. S. Colhuru; and a Letter from George Washington dated Philadelphia, and addressed to "My dear Tarry," in a plain, substantial and agreeably impressing hand.

CLASS XV.

Carriages and Wagons.

Manufacturers of carriages have interested themselves in the Fair, and the result is a good showing of their best productions. The first thing to catch the eye is F. A. Huntington's patent buggy spring, which is applied to buggies manufactured by A. Folsom, and intended to secure the advantages of cheapness, lightness, strength, and durability. It is a wooden, double lever side spring, with rubber cylinders acting as a fulcrum, to afford the elasticity.

A serviceable express buggy with side springs, is exhibited by the Pacific Union Express Company.

Harris & O'Brien exhibit a lever side spring buggy, similar to the one above mentioned, except that the elasticity is afforded by spiral springs at the end of the lever. Also a race-track wagon, weighing 100 pounds, with spring seats to break the jar, merely, of the vehicle; an advantage which is secured by means of four rubber supports in tubes under the four corners of the seat.

Another peculiar adaptation of the wooden side lever spring, is shown in a plain buggy having rubber as the elastic principle.

Folsom exhibits two very handsome light buggies, embodying the American idea of limberness with the best quality, and dispensing with all dead weight.

Kimball has quite a number of buggies with the "C" or Kimball spring, of exceedingly light and neat appearance. The C spring is a wooden bow with a leather strap sustaining the bow, as in the Concord stages. There are besides, by Kimball, a very stylish barouche, for four horses, a pony phæton weighing 250 pounds, with end springs, four more buggies of different designs, and a hotel side-seat omnibus.

John Aylward, of San José, exhibits a strong, neat, serviceable buggy, with old style end springs, and strength enough to withstand Russian usage.

Gallagher Brothers exhibit a well-made common market cart.

Casebolt & Kerr show four serviceable top buggies, very neat and light, with end springs, and two similar ones without tops; also a case of silver-plated carriage fixtures of beautiful design and finish.

A velocipedo of California invention and original construction, is exhibited by Chas. A. Way. The third wheel, which serves as guiding wheel, is behind the back of the occupant, and is controlled by his feet through the agency of connecting rods.

THE MEUSSDORFFER BROTHERS, whose extensive business demands the establishment of branch houses at Marysville, Sacramento and Portland, are men of real genius in their line. The writer has been familiar with their manufactures, extending over a period of many years, during which time the uniformly good character of their articles have been fully sustained. We know their interesting history from the fatherland, and their early struggle as pioneers in our own State. They have been a race of hatters from generation to generation, and all the secrets of the craft are in their possession, while they are not wanting in experience, having worked as journeymen in some of the first establishments of the trade on the eastern continent, before their advent on these shores.

Scientific Miscellany.

DEPOSITION OF IRON BY GALVANISM.—When ordinary green vitriol is dissolved in water, and the solution connected with the copper cylinder of a single Daniell's element, by means of an iron plate which plunges into the solution, whilst another metallic plate, also plunged in the solution, and on which it is wished to deposit the iron, is connected with the zinc of the battery, this is what we observe: When both plates are of about the same size, it is true that a thin coating of iron will be obtained, but it will remain very thin, and generally an abundant evolution of gas will occur. But if we now place in the solution, and in connection with the iron plate, a notable quantity of rolled iron wire, the deposit of metallic iron will be increased in thickness comparatively with its surface, and the work proceeds with regularity. But the iron thus precipitated has a strong tendency to become warty on the edges; it is very rough, and so hard that a good English file can scarcely touch it. It is, however, so malleable that it can be rolled round a glass tube.

The vessel in which the iron solution is contained must be large enough to allow the two plates to be at least four or five inches apart, and it is perhaps best to separate them by means of a glass diaphragm which does not reach to the bottom of the liquid. According to Dr. Varrentrapp, an iron coating thus deposited upon a model will be as sharp as a copper deposit, provided the model be thinly coated with silver, and then blackened by being immersed for a short time in a solution of sulphureted hydrogen; this also allows the iron deposit to be easily detached without losing its form, even when it is no thicker than a sheet of paper.—*Scientific Review.*

GLACIERS IN THE WHITE MOUNTAINS.—Geo. L. Vose, in a paper upon the subject published in the *American Naturalist* for August, has the following:

There is at first sight a marked difference between the glacial furrows and polishing in the Old World and in the New. In Europe these marks upon the rocks are found in certain mountain regions, and always referring us by their direction to the higher parts of the mountain groups; thus showing that the glaciers moved down from the higher to the lower lands. This is plainly seen in the Alps, in Scandinavia and Great Britain. In America, the traces upon the rocks, as a general thing, appear to have been produced by a far more wide-spread operation, inasmuch as the furrows have a prevailing southerly direction, regardless of topographical features to a remarkable extent, as they pass directly over and across some of the largest ranges of mountains. Throughout New England, the most common course of the furrows is about S. S. E. The wide extent of these traces would seem to point to some very general operation as a cause.

The author proceeds to call attention to a different class of traces, which seem to show that in addition to the above general operation there have been local glaciers, belonging to separate mountain groups, and moving down the valleys in various directions.

STONE IMPLEMENTS IN INDIA.—At a recent meeting of the Geological Society of London, R. Bruce Foote, Esq., F. G. S., read a paper upon this subject. The implements found in Southern India are nearly all of quartzite, and show a marked similarity, as regards their type, with the flint implements of Europe—suggesting the common origin of the races which peopled the two countries.

THE SEA IN PAST EPOCHS.—Andrew Murray, Esq., F. L. S., in opposition to Sir Charles Lyell, thinks that instead of the proportion of dry land to sea having always been the same, and its volume above the level of the sea a constant quantity, they are constantly increasing, while both the mean and extreme depths of the sea are constantly diminishing; the cause being the extreme affinity which water has for the constituent elements of minerals. In illustration of his view, he quotes the so-called upheaval of coral islands as being really caused by a diminution in the volume of the sea.

Mechanical.

Corrosion of Marine Boilers.

The rapid deterioration of marine boilers by corrosion is often inexplicable by any sensible theory. Sometimes one side of the steam space is attacked, while the other remains untouched. In boilers, similar in every respect, corrosion takes place in one on the right side, in another on the left. Now it is the portion nearest the funnel which suffers most; again it is a single plate furthest from the uptake that is eaten away. At one time the plates attacked are deeply pitted, at another the iron exfoliates in flakes. The *Engineer* advances the following theory upon the subject; not insisting that it is perfectly satisfactory, but believing it the most so of any which have been offered: "The most probable solution of the problem is found in the effect produced by pure distilled water on wrought-iron. It is now perfectly well known that distilled water from surface-condensers rapidly destroys the plates of boilers, and in order to protect them it is necessary that sufficient salt water be admitted from time to time to maintain a thin coat of scale. If it can be demonstrated that pure water is brought into contact with the plates of a steam-chest, we can at once establish a reasonable theory to account for their corrosion, as like causes usually produce like effects. Now, marine boilers are alternately hard-worked and left at rest when the fires are drawn; as the boiler cools down, pure distilled water will be precipitated on the steam-chest plates by the condensation of the steam, and the water may be present in sufficient quantity, and the precipitating process may be sufficiently often repeated to render the corrosion explicable." The journal above-named considers Mr. Bourne's theory, that the corrosion is due to the action of superheated steam, untenable; and says that unless it can be proved that superheated steam is present in one place and not in another, it is difficult to see why one plate should suffer more than another. It is true that superheated steam much hotter than 280° disintegrates *cast* iron; but it has yet to be demonstrated that any corrosive effect of a similar character, or indeed of any kind, is exercised on wrought-iron.

CHEAP STEEL RAILS. — In an article on the question whether steel rails of good quality can be made at a reasonable cost, *The Engineer* has the following:

At the last meeting of the Institution of Naval Architects, Mr. Rochussen exhibited specimens of puddled steel plate quite homogeneous in texture, produced from a single bloom weighing 150 lbs. These specimens were compared with puddled steel plates rolled from a hammered pile made of shingled bars, and showed a finer grain, and a tensile strain of 51 tons per square inch, as against 31 tons. Their ductility was less, but there was reason to believe that it was not too small for rails, and therefore it was determined to endeavor to produce rails in the same way. A single puddled ball is not large enough to produce a rail, and attempts had been made to weld two or more balls together under a 25 cwt. hammer without success. Either the blooms would not hold together, or the resulting rail lacked homogeneity, and was correspondingly bad. A fresh experiment was made with a 12-ton hammer, and the result has so far been eminently satisfactory, excellent rails having been produced at the Hoerder Iron and Steel Works, Westphalia, within the last few weeks, by welding together three or four balls into one homogeneous bloom. The faces of the hammer and of the anvil are concave, so as to keep the metal together, and not only is the slag driven out, but the weld is perfection. The rails rolled from these blooms have a grain almost as fine as cast steel, and much finer than that of rails made in the old way from bar piles. The crop-ends, when slowly and strongly heated, can be rolled with ease into flat or round bars, plates, or light tram rails, so that there is no waste of material. All the expense of shingling, cutting, and piling, is saved, and considerable economy of fuel, room, plant, and capital secured—in a word, we have here an extension of the principle of getting the greatest amount of work out of a given number of heats. The experiments are still in progress, and even better results than those already obtained are likely to tend on improvements in a method of manufacture yet in its infancy. The essentials to the success of the process appear to be getting the puddle balls all to the anvil at the same time and then applying very great hammer power, while the balls are at the hottest.

General Review of the Exhibition.

[Continued from Page 131.

CLASS XVI.

Leather and Leather Work.

Edward Galpen & Co. show a largs assortment of valises and trunks.

W. Bloom, wool puller and sbeepskin tanner exhibits, some bundles of leatber of bis own production.

S. Hoffman & Co., tanners and curriers, exhibit calfskin and hoot leathcr of their own manufacture, in whicb branch tbey "defy Frencb or Eastern competition."

H. Royer exhibits fulled rawhide, and some leather belts and lacing made of tbat material.

M. M. Cook & Son exhibit heavy beltings, with a patent brass eyelet to serve as a fastener, wbich has many advantages over the ordinary string fastening; also hose, fire nozzles, fire buckets, and horss collars of superior quality.

Very substantial fire hose and nozzlss are exhibited by John J. Fulton.

Boxing gloves are shown, in the midst of more sanguine weapons, by Liddle & Kaeding.

Trunks and bags of leatbsr are exhibited in considerahle variety by Heuston, Hastings & Co.

A large and splendid assortment of California made leather of the best quality that can he bought, together with some imported specimens, are exhibited by Tyler, Curtis & Co.

The Pacific Tannery Boot and Sboe Company exhibit not only a large snpply of fine home-made leather, but an extensive assortment of sboes manufactured therefrom.

The Singer Sewing Macbine Company exhibit a case of uppers made on the Singer machine; tbe Cooperative Union has a case of delicate ladies' shoes, neat and Frenchy in style; Wentworth, Hobart & Co. ehow eimilar work, besides beavier articles intended for use, hung up and in cases; a sewed sole lies on the table alongside, illustrating the serviceable character of the soles turned out by that firm; Buckingham & Hecht exhibit a large quantity of the kind and quality of shoes most called for, and attract the curious hy a euspended brogan weigbing 39½ pounds, and of size "No. 105," the uppers of this shop being stitched on Grover & Baker's sewiug machine; W. T. Burke exbibits light and heavy ladies' shoes; amongst the latter a very neat and wholesomely substantial looking article, be sides 26 samples of shoe work hy as many different hands, illustra'ing individualities in executiou; P. Kelly, men's fency riding boots, and ladies' shoes; aud L. Price, light and fancy ladies' shoes.

Saddlery is represented by G. Vallinger, who exbibits two ladies saddles with douhle horns; by Main & Winchester, in a splendid exhibition of everything helonging to the trade, including saddles, barness, whips, and a etuffed horse; and hy Joseph Hamilton, wbo sbows a circus pad made for Miss Lee, and a $25 lady's saddle.

CLASS XVII.

Sign, House and Carriage Painting.

More tban a dozen firms are represented in tbis department, and tbeir productions are located on tbe walls at tbe rear end of tbe main building, and around tbe fountaiu.

Tbree splendid sample letters, "BAT," by H. M. Newball & Co., on glass, are probably tbe most elaborate tbing shown, of the kind.

John W. Cberry exhibits block letters, and ordinary painted signs, on wood and on glass. Jester & Hicks, and H. M. Rosekrans have their names represented in the same place.

Robert Mills, John Mallon, and Thomas O'Neill, glass painters and cutters, show specimens of their work in the vicinity of the fountain, and in the windows above the rear gallery.

Block letters aud carved sign work are further represented by Paul Gihot, at the eutrance to the Music Room.

Metallic signs of polished and rich finisb, are shown at the rear gallery steps, by Andrade & Patterson, who advertise to do work at New York prices.

In the same vicinity are Sweett & Gadsby, ordinary sign painters; and George M. Wood and F. M. Truworthy, steucil plate cutters.

CLASS XVIII.

Furniture, Upholstery, Billiard Tables, and like Work for Amusement.

This subject has been partly disposed of under "Wood and Wood Work, Class X." The names of the firms may be again mentioned: Goodwin & Co., N. P. Cole & Co., Wigmore & Palmer, Johnson & Best, and tbe Pacific School Institute of Warren Holt. Slocum & Kinzer, of San José, exbibit a patent hed spring of vulcanized rubber attacbed to the ends of wooden slats, the effect of wbich is more satisfactory tban would he supposed on merely looking at it.

An interesting feature in this department is ths Elastic Sponge Company's exhibition of tbe application of scraps of Florida sponge for cusbions, to supply the place of bair. The sponges are gathered and dried on tbe Florida banks, and shipped to New Lebanon, New Hampshire, where they are deodorized, cleansed, saturated with glycerine, dried, and baled by means of powerful presses into compact bundles of 40 to 100 pounds. As proof of the remarkably elastic properties of sponge, Dr. Ferris opens little hundles whicb have been lying for weeks pressed into tbe solidity and compactness of wood. The little scraps open up gradually but surely, into a heap so large as to excite the wonder of the spectator.

Billiard tables are exhibited by P. Liesenfeld, of laurel; one with pockets at tbe corners, which may be closed wheu desired by a patent swallow tail shaped cushioned hlock, and anotber smaller one, without pockets; and hy Strahle & Hughes, of laurel and rosewood combined, without pockets.

Wood carving on furniture is represented hy a master hand, in a turkey and other fowl carved on Bryant & Strahan's splendid sideboard, at the left entrance to the Art Gallery.

"*Le Militaire*" is a Frencb naming of what looks like and ought to be a Yankee idea. It is an improvement on bowling, in tbe matter of setting up the pins merely, end returning the balls to the player, whereby the services of a boy can he dispensed with. By means of a wire with a lever at one end, and string attacbments to tbe ninepins at the other end of the alley, the player sets up all the prostrate pins by one motion of the hand, and then relaxes the strings again by returuing the lever to its original place. It is exbibited by J. D. Patrick, inventor, of San Francisco.

CLASS XIX.

Stone Cutting, Artificial Stone, Polishing Material, Plaster Casts and Sculpture.

Tbe builders and stone-cutters, like the brick-makers, bave deemed their material too common to be worthy of exhibition—erroneously—and have therefore seut nothto the Fair.

Ransome's artificial stone, exhibited unthe name of E. T. Steen, was being made under the eyes of visitors at the entrance to the agricultural department, a few days a;o, but the operations have recently taken o1 an appearance of repose. Specimens may be seen, however, of small articles of oruament, manufactured from oemented sand, hy this process, which was patented in London eigbt or ten years ago.

A California grind stone, five feet in diameter, is exhibited by F. Robinson, of Vallejo Mills.

Redington & Co. exhibit polisbing material from Nevada, under the name of electro silicon, or magic brilliant. It is a white, chalk-like substauce, composed chiefly of silica, which, upon examination by a microscope, would probahly sbow it to he an agglomeration of the armoured shells of extinct diatoms, deposited in past ages, like coral.

Statuettes of porcelain and imitation bronze, imported, may he seen in considerahle variety and of great beauty, in tbe show cases of R. A. Swain & Co.

Original work in sculpture is exhibited in the art gallery by Arthur Lemorz, of Oaklaud; a female bead, which seems to be modeled after life, entitled "Isbael." It is a work of merit if original.

Stretch's relief map of tbe Virginia City country, on a scale of four miles to the inch, is interesting to those who are acquainted witb the localities represented, and evinces superior qualifications and commendatory enterprise in the pursuit of bis special branch of mining engiueering.

P. Mezzara makes a fino aud varied exbibition in sculpture, viz., a sleepiug child and dog modeled after life, of plaster; a well executed statuette of George B. Baker, tbe artist, wbo lost his right hand in the war, but not the powers which taught that member to paint, also of plaster; and a large number of cameo portraits of artistic quality.

GOLD AT LARAMIE.—Considerahle excitement exists at Laramie over the new gold discoveries, about 40 miles west of that place, which are said to be richer than any previous discoveries in that section of country.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to NEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING AUG. 11, 1868.

80,838.—IMPROVEMENT IN GANG-PLOW.—Andrew Smith and William P. Watson, of Portland, Oregon:

1. I claim the combination of the rod K, plate J, through wbicb the rod K screws, and wbich is attached to the hinge-joint I, hinge-plate I, plow-heams F, F, and standards and plows G, H, substantially as described.

2. The combination of tbe binged beams F, F, cord *c*, rollers M and N, ratchet *m*, pawl *p*, and foot lever *r*, substantially as described.

3. Attaching the rear end of the tongue to the axle by means of a clevis *t*, and a series of boles arranged as described, by which the draught can be changed, substantially as above set forth.

80,856.—IMPROVEMENT IN STREET PAVEMENTS.—Philip Caduc, of San Francisco, Cal., and W. H. De Velin, of Sacramento, Cal.:

1. I claim the application to a cobhlstone pavement, or walk, of the herein described composition, substantially in tbe manner set forth.

2. The tapering or inclined side blocks, molded and formed from the composition herein described, in the manner set forth.

3. A pavement or walk made of composition blocks, molded and formed as set forth, and united or cemented together, after being laid or placed in position, in the manner specified.

80,924.—IMPROVED BELT BUCKLE.—Wm. Cummings, of Sacramento, Cal.:

1. I claim the points provided with shoulders or rings near the end.

2. Tbo lever, so arranged as to press said points through the helt and against the plate, substantially as set forth and described.

80,928.—IMPROVEMENT IN LATHE CHUCK.—J. S. Detrick, of San Francisco, Cal.:

I claim the hack plate D, constructed as described, in combination with the sliding chuck and adjusting screw C, all eubstantially as set forth.

81,024.—IMPROVEMENT IN VALVES FOR WATER CLOSETS.—W. Smith, of San Francisco, Cal.:

1. I claim tbe tube D, applied to the face of a self-suspending water closet valve, with water-way at its base, substantiellyas shown and described, for the purposes specified.

2. In combination with the tuhe D, the spindle E, with the disk and packing *h*, and the packing L, compressed by the spring R, substantially as shown, and for the purposes set forth.

NATIONAL NOTIONS.—Every nation bas its peculiar notion on some eubject. For instance, the Chinese bave a notion that a man without a tail to bis head, is more deserving of deatb than a tailless toad. The English have a notion tbat roast beef and plum pudding are tolerably good eating; the Scotcb notion is oatmeal and scratcbing posts; the Irish, whisky and figbting; the Dutch, eour kraut and lager beer; the French, frogs and fricacees—and so on till you come to the Yankees, wbose notions are expanding everywbere, as they embrace liberty for all men, love for all young women, rocking-chairs for all the old ones, and habies for all who want them. Sewing machines, reaping machines, railroads, telegraphs, and steamers, are Yankee notions. Tbe many useful things at the Fair are a fair specimen of the California Yankee notions.

SCHOOL-ROOM FURNITURE.—Not a wbit bebind tbe advancement tbat has been made in the construction of school-houses and tbeir internal arrangements, bave been the improvements in scbool-room furniture as indicated by tbe exhibition of Messrs. Wigmore & Palmer, before the Mechanics' Fair, the display of which is worthy the attention of all classes. Few of us who have borne tbe burdeu of the day on hard, rude oaken seats in the primitive New Eugland scbool-house, that will uot be stirred with lively reminiscences of the old box stove, the desks, all of the older pupils having the wall, with the scbolar's back to the teacher, and the dove-tailed seats for the smaller ones nearer to tbe "master" and tbe fire.

A New and Important Invention.

We always take pleasure in speaking at length of a truly valuable invention, especially wben it is original in California. In examining the many important macbines on exhibition at tbe Mechanics' Fair, we are impelled by a sense of duty to notice in detail a simple but valuable labor-saving machine whicb is there exhibited. Goff's Patent Portable Cross-Head Wrist Pin and Crank Pin Latbe, was patented by Theodore A. Goff, and entered by Messrs. T. A. Goff and R. B. Bishop, both master mechanics of our State. It is a small portable macbine, to be applied to unevenly worn cross-bead wrist pins and crank pins, in engines, aboard of steamers, locomotives, or other machines which cannot be taken to the machine shop. The work is now necessarily done by filing, and a number of hours or days are lost in getting out the part requiring repair. Witb this machine it is easy to make a perfectly round and true pin or steamsbip shaft on the spot. The great advantage is, that the pin or shaft heing true, there will be very little wear to the hox, and the entire machinery will run so much bstter and longer. The one on exhibition is particularly adapted for turning off cross-head wrist pins on locomotive engines. A description of this machine, condensed from the specifications, may serve to interest the capitalist, as well es the mechanic.

The invention consists in the employment of a hoop, or ring, put around the work to be turned off, by being made into sections and revolved about it in a grooved case for the purpose of carrying the cutting tools. The cese is also in two parts, and is supported by, and elides back and forth laterally upon, the guide-rods carried by the feed screws in the usual manner. We will here remark that the proper frame for any kind of work will naturally suggest itself to a machinist who will examine this invention.

The operetion of the machine is as follows: Place the cutter-ring at one end of the pin to be turned, then adjust the cutter nearest the other end of the pin for a chip and the rachet for feeding in the proper direction; then turn the crank until ths ring crosses the face of the pin; then adjust the other cutter for a chip; change the feed and turn the crank as hefore, and so on back and forth until the pin is turned to the eize desired.

This machine is no improvement on any other, but an entirely new one, no machine ever having been invented to do the kind of work for which this is intended. The machine now on exhibition has been in use for the past eigbt months upon the San Francisco and San José Railroad, and has given entire satisfaction. As proof of whet we state, we append a certificate of an engineer on the road:

Tbis is to certifiy, that a box has been running in a crosshead of the locomotive "San Mateo" for the past seven month. The locomotive ran over 20,000 miles during that time, and the box was not removed for repairs. The pin on wbicb this box rnn was turned off by one of the Goff'e Patent Portable Wrist Pin Lathes.

SAMUEL SAWYER,
Engineer on the San Francisco and San José Railroad.

NEW MINES NEAR THE RAILROAD.—Rich gold and eilver lodes have been discovered in tbe Pyramid Lake country, Nevada, within six miles of the Central Pacific Railroad. The Imperial Consolidated Mining Company, on the morning of August 11th, despatched a company of workmen to their mine in the new Truckee District, ahout six miles from the Pacific Railroad, at the Hot Springs, 65 miles east of Virginia City, to commence taking out some of thsir rich argentiferous ore, preparatory to having it transported over the railroad to Reno. The same company has purchased tbe fine residence of the widow Plato, on the east side of Main street, Gold Hill, Nevada, between the old and new shafts, at a cost of $3,500, and will fit it up in handsome styls for an office.

THE BEST IN THE WORLD.—Gcvernor Haight has received a gold medal from the managers of tbe World's Fair at Paris, as a proof that California exhibited the best wheat there. Cock-a-doodle-doo! what State wouldn't crow over sucb an honor?

A BRICK chimney, one hundred feet high, in Worcester, Mass., has been moved four hundred feet without stays or tops.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board
San Francisco, August 29, 1868.

City Stocks.

The transactions in other than mining stocks during the past week have been quite limited, prices for the most part being well maintained. Spring Valley Water Co. stock sold to a limited extent at $65 25 per share. State Telegraph Co. stock has been sold at $27 50 per share.

At the annual meeting of the North Beach and Mission Railroad Company, for election of Directors, on Monday, the 24th inst., the following named gentlemen were elected for the ensuing year: Henry A. Lyons, John S. Hager, Alpheus Bull, E. F. Northam, Michael Reese, Jerome Lincoln, Michael Skelly, and James T. Boyd. At the close Spring Valley Water was sold at $66. The Pacific Bank will pay its usual dividend on the first of September.

Mining Share Market.

The mining share market exhibited some animation since last Saturday, and early in the week nearly all stocks were in better request at enhanced rates. A slight rccession was apparent immediately after this healthy advance, nevertheless the market has received moro huoyaney and greater inclination is shown hy outsiders to enter the stock arena and contend for the spoils. Increased confidence is also exhibited as to fature developments in the lower levels of the various claims, while not a few belicve that prices will soou he considerably advanced over presont rates. As soon as the least rcliable intimation reaches this market that ore has been found in well-defiued bodies in the present deep workings of the various companies, stocks will receive an nnusual impetus, and the advauce will be proportionately great. At the close the market exhibited marked improvemeut.

The qnarterly assessment roll of the proceede of the mines of the different couuties of the State of Nevada, for the quarter ending March 31, 1868, contains the following figures:

County.	Ore Extracted.—Tons.	Av. Value per Ton.	Total Value.
Storey	44,017	$30 42	$1,338,873 23
Storey (ore sold)	8,238	.....	9,738 16
Lander	2,003	174 81	350,211 13
Nye	1,903	122 43	233,019 34
Esmeralda	836	42 09	35,206 46
Humboldt	186	59 85	11,102 94
Totals	57,263	.....	$1,978,151 26

Savage—rose from $112 to $118, declined to $114, and closed at $114 75. Up to the 22d for the past four weeke this company sent 4,000 tons of ore to the mills, and the yield of bullion to date for the preseut month has been $123,500. During the week endiug August 22d 1,086 tons of ore were extracted, ehowing an approximate value of $37 21 per ton. Thie amonnt wae taken from the followiug localities of the mine:

Third Station, north mine	30 tons.
Fourth Station, north mine	68 "
Fourth Station, south mine	826 "
Fifth Station, north mine	26 "
Fifth Station, south mine	136 "

The previoue week the yield amounted to 1,210 tons. Going north from the fourth station on the 50 level, toward the "five points," an improvement in quantity and quality is noticeable. In the south mine, same level, the main hreasts look very well. The north mine, on the fifth level, ehowe uo change, and the main hreasts of the south mine have not been as good as usual. Work ou the sixth station continuee to he impeded by water, and most of the workmen on this level are employed in repairing the drifts. In the eouth drift they have not yet found euough ore to pay for saviug.

Crown Point—has been in good demand at the late advance, selling at $89.50@91, receding to $88, and closing at $87 75. The August receipts of bullion so far foot up $60,167. The stopes hetween the 700 and 800 levels show no chauge from previous reports, and the prospects of the 900 level are exceedingly flattering, the drift being in 184 feet, with ahout 25 feet to run hefore reaching the ledge near the east wall. The drift ie now ncarly under the winze from the 800 level, the latter being down 100 feet. They hoiet ahont 100 tons of ore daily, and the average yield for the month will he $38 or $40 per ton. A small opening hae heen made tlrongh east drift of the 900 level with the winze, giving a good current of air. It will take eeveral days to open drift to wiuze.

Kentuck—wae in the market at $440@425, closing at $432 50. Up to the 24th the receipts of bullion for the present month amounted to $89,549, against $60,186 same time in July, and $41,137 in June. The receipts for the present month will average over $50 to the ton.

Gould & Curry—sold at $92@106, and closed at $107. In the Bonner shaft, at a depth of 1,043¼ feet, they found some quartz on the 22d which had a very promising appearnuce. Later advices are still more encouraging, they hav ing found larger quantities of quartz, and better looking. Similar looking quartz was obtained from the Hale & Norcross at a depth of 1,030 feet.

Impebial—advanced from $117 50 to $128, declined to $118 50, and closed yesterday at $120. In raising from 700 level up they found the pay ore to he eight feet wide, and is hest on the west wall. On 600 and 700 levels there is no change, both levels continuing to produce average quality of ore. In raising from 900 level there is no change, and they make about two feet per day. The winze from 700 level of Alta shaft has run out of pay ore, having left the ore under the foot wall of the iucline. Ou the 26th inst. $10,952 in hullion was added hy shipment to the rceeipts of August.

Hale & Norcross—was quite active, rising from $85 to $90, then selling at $84, and at the close realizing $90. Work is progressing well in this mine, without any favorable change at present. They are running in a north drift in the west portion of the vein, and have heen in quartz all the way. If there is any ore it is helieved to lie further to the east, in the north drift. Two strata of quartz, running close together, are reported to exist in the north portion of the mine. In the south drift they are keeping close to the east wall, but have no ore as yet that amounts to anything, and they will therefore cross-cut to the west in this drift. On the 28th the quartz had somewhat improved in the south drift, with some streaks of ore, bnt uo body yet.

Chollar-Potosi—sold to a larger extent than usual, advancing from $157 50 to $190, then selling at $174@191, and closing at $189. During the week ending August 21st extracted 1,044 tons of ore. This ore comes from the Blue Wing stope, and the quautity and quality is said to be increasing in this portion of the mine, the pay streak as now opened heing 55 feet wide hy 105 long. From the eleventh floor they have run a proepecting drift 87 feet north, and found a promising streak coming in at the southeaet corner, and from the twelfth floor they drifted 66 feet eaet through vein matter but no pay ore. On the thirteenth floor they drifted 48 feet southwest, aud found considerable millable ore. Work at 1,100 level continues in hard rock. On the 26th inst. sent forward $13,879 in bullion.

Overman—came into the market quite freely at a marked decline, having advanced to $115, theu dropped to $74, and closed at $83. It is reported that the developments on the 500 level arc of an encouraging nature, and they inteud to extend the drift to the north line. The breasts in the 300 level, south, look well, and work continues uninterruptedly. $3,646 was sent forward ou the 24th inst.

Amador—wae in the market at $245@250, closing yesterday at $240. On the 26th inst., the Eureka and Badger shafts were connected by drift, giving thorough ventilation to hoth mines. The developmente of the Badger vein are of a very satisfactory nature.

Golden Rule, (Cal.)—paid a dividend of fifty cente per ehare on the 26th inst.....Julia—levied an assessment of $1 50 per share on the 24th instant.....Bullion—levied an assesement of $10 per share on the 19th inst. This ie the thirty-first assessment levied hy this company, and have never dishursed a dividend.

The sales in the Board during the past week have been as follows: Open sessions, $652,415; regular sessions, $2,038,120—total, $2,690,535.

PATENT DIAL CANCELING AND BANK STAMP.

These are the ONLY STAMPS having a Dial to indicate the dates. After a year's trial, the Dial Stamp has proved to the public that it is perfectly reliable in every respect, and for convenience, durability and price, has no equal.

The dates are all cut on a solid wheel, which makes them durable, and not liable to get out of order.

These Stamps are manufactured of the best material in the most perfect and substantial manner.

JOHN C. HODGE & CO, Agents,

329 and 331 Sansome street, S. W. cor. Sacramento, San Francisco.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Aug. 15th: Yesterday the workmen in the Globe tunnel struck through a hard streak into softer working and sulphuret bearing rock. Ore from the small lode cut a few weeks since assays $7 per ton.

The rains of last winter brought to viewa vast amount of black sulphurets on the waste dump of the Tarshish.

The Pittsburg mill, it is expected, will commence running on L.X.L. ore about the first of next month.

Mr. Geo. C. Potter, for several years past City and County Surveyor of San Francisco, has been placed in charge of the Tarshish works.

Amador County.

Jackson *Ledger*, Aug. 22d: The smelting works at the Newton copper mine are being rapidly pushed to completion.

Dick Palmer is hard at work prospecting for auriferous deposits on the foot-hill range.

Within two weeks the Kennedy quartz mill will be running. Everything is being done to push it forward as rapidly as possible. The machinery and works are of the best and latest style.

Robert Ludgate and Capt. Jack Miller, of Ione City, discovered and located a coal mine, Wednesday. It is about two miles southeast of Ione City, and the croppings are said to equal the best coal taken from the old mine.

Mono County.

A dispatch to the *Times* of this city, dated Aurora, August 25th, gives the following: The largest amount of bullion ever brought to this town for assay, arrived here to-day from Benton, Blind Springs district, Mono County, Cal., and was deposited at the banking house of F. Garesche. It was smelted in Williams & Wekland's furnace, out of ore from the Diana mine, located in that district, and owned by these gentlemen. There are 137 bars, weighing 8,843 lbs. As it has not yet been assayed the value is unknown.

Nevada County.

Transcript, Aug. 19th: J. Hamilton & Co. have located a claim on Greenhorn Creek containing 600 feet,—fronting on Cascade Ravine and north of the Mountaineer claim. It is known as the Pennsylvania Co.

The Annie Quartz Co. have located 1,400 ft. on a ledge situated 1¼ miles from Eureka and about 300 feet below Black & Young's mill.

Aug, 21st: From Bill Davidson who has just returned from Eureka, we learn that the Birchville mill is crushing a lot of first rate float quartz.

Sweet & McElvy have let a contract for taking out 200 tons of rock.

The frame work of Palmer & Everingham's mill at South Fork is nearly completed.

We understand that the mines at Remington Hill, Little York township, are paying first rate this season. Two compauies are at work taking out considerable dust.

A party of Grass Valleyans have located 1,600 ft. on the Grass Valley Slide Ravine. They have called it the Seymour ledge, which ie sufficient to make it peter.

Aug. 25th: W. A. Martin & Co. have located 2,000 ft. on the extension of the Camanche quartz ledge at Diamond Creek, Washington township.

Gazette, Aug. 24th: For three months past the Eagle Gravel Co. have heen running a tunnel on Frink's ranch, jnst above the Gold Flat ditch. The tunnel is now in 180 ft., and within 50 ft. of the old river channel about 30 feet below the bottom of the shaft, low enough for sluicing or hydraulic purposes. A one-fourth interest in the claim was sold last week for $600 cash. The gravel in the hottom of the shaft prospects splendidly.

Grass Valley *National*, Aug. 22d: The machiuery and works of the Ione mill which were recently purchased by the proprietors of the Coe mine will he put up and ready for work within three weeks.

The Empire mill cleaned up the sum of $40,000 last week, after a run of 22 days.

Grass Valley *Union*, Aug. 20th: One of the most remarkable mines in the State is that of Abergast & Nichols, about ouc mile south from Rough & Ready in this county. The ledge is about six feet in thickuess, and is encased in slate, the quartz beiug decomposed. The owners when they want money, take a pan and go after the gold, and often pan out $1,000 in two hours. They are uow about 70 ft. down on the ledge and it shows wonderfully rich, all the way down. They refuse to sell the mine or any portion of it, for any amount of money which can be offered. Their claim is 6,000 feet in extent. They have no machinery at the ledge, and do not seem to care to crush their rock.

Aug. 21st: Mining operations at Graniteville are very active, and most of the companies are making money.

Aug. 24th: The mines at Eureka are looking remarkably well. The Jim mine, or as it is now called, the Mutual Gold Mining Co's 5-stamp mill is yielding a very good quality of rock. The last clean up, after a run of 33 days, gave 150 ozs. The gold is of excellent quality, being worth $17.50 per ounce. The Valentine mill, which has 10 stamps, is doing a good business and crushing a fine quality of rock.

Excelsior.—Virginia (Nev.) *Enterprise*, Aug. 23d: We learn from Mr. Frederick, who returued from Meadow Lake evening before last, that the Mohawk & Montreal Co. have struck a deposit of exceedingly rich ore in their mine. One hlast threw out 10 tons of rock, in almost every piece of which free gold was to he seen. The ore contains so much free metal that it has been thought hest hy the Superintendent not to send it down the hill to the mill hy the chutes, as a great amount of the gold on the outside of the pieces of ore would he ground off and lost. The ors is therefore being packed down to the mill upon mules. Two or three Mexicans and eight mules are now employed in this husiness. We have bsen shown specimens of the ore that are full of free gold in coarse particles. The Mexicans engaged in packing the ore have offered the company $100 per ton for it as it comes from the mine, hut having a good mill of their own upon the ground almost completed, they prefer to work it themselves. Their mill contains 10 stamps, and is in every respect the most complete in the country. It will start up this week, and Mr. Collins, President of the company, expects shortly to bring in his first gold brick. The company have laid in a large supply of wood, all of which is roofed over, as well as the incline track leading from the mine to the mill, the main shaft and everything about the works, so that next winter both mining and milling can be conducted without going from under shelter for anything. The main tunnel now connects with the shafts sunk upon the croppings and hy means of drifts and chutes the company are in a position to extract almost any amount of ore and land it in their mill at a trifling expcnse, there being no hauling to be done.

Placer County.

Dutch Flat *Enquirer*, Aug. 22d: A Gold Run correspondent writes: I do not think that at any time since the mining season commenced, there has heen more doing in that branch than at the present time.

Geo. Slocumb & Co. are sinking their shaft rapidly, and we expect soon to hear that they have struck a big thing in the blue gravel; if they do, the bottom ground around this place will last a number of years. The claims of Messrs. Huyck & Co., Carr & Co., Brogan & Co., cleaned up last week, and as far as we can learn fully realized the expectations of their owners.

Plumas County.

Quincy *National*, Aug. 15th: Hallsted's mill, in Granite Basin, has been running about a week crushing rock from the Jennie ledge. The mill crushes about 14 tons per day, and will clean up shortly. From the prospects they think they have some good paying quartz.

ARIZONA.

Prescott *Miner*, August 1st: The "Conquest" mine, about five miles northwest of La Paz, Yuma County, is one of the richest and hest developed mines in Arizona. Its owner, Manuel Ravena, is well satisfied of its ricbness and permanency. To give an idea of the amount of labor that has been performed on this mine during the last four years, it is necessary to state the fact that eighteen shafts of from ten to seventy feet in depth, each, have heen sunk upon the lode, at different points inside the length of the claim, 1,200 feet, and in all of those shafts the lode has been struck, thus proving it to be a true vein. The width of the vein averages from 3 to 21 feet; the rock is decomposed, and is very rich in free, fine gold. A mill will soon be erected to work the ore from this ledge, and we learn that Mr. Ravena has arranged his business so as to be able to devote his whole attention to working the "Conquest."

We have no news from the Williams' Fork copper mines, further than that they are being worked.

A party of nine men are now prospectiug the range of mountains hack of McMullen's station, on the Prescott and La Paz wagon road.

Parties are negotiating with Little & Taylor for their valuahls mining property on Lynx Creek. Should they make the purchase, work will be commenced upon it immediately.

Mr. Basham has leased from S. Z. Pierce his placer claim and ditch, below the Excelsior claims, and is now at work.

Groom & Cole are sinking a shaft on the Platanka lode.

Work is going on at the Chase. Good rock is being taken out of it.

Nothing is being done on the Chloride, on account of the great quantity of water in the shaft.

From Lynx Creek the news is very favorable.

ALASKA.

Helena (Montana) *Post*, Aug. 14th, says: Tom Fairweather has just rcturned from an extended prospecting trip in Alaska. He prospected through the British Possessions until he struck a tributary of McKenzie River, where he worked placer diggings, but realized only $4 50 per day the hand. The climate is mild and the winters not as severe as in Montana. His 15 months experience in the northern country induces him to return there next spring.

BRITISH COLUMBIA.

A telegram to the *Times* of this city is as follows:

Great excitement has been created hy the discovery of a large prospect ou Peterson Creek, about 18 miles west of Parkervills. It was discovered by a man named Kennedy, and from the quantity of gold already taksn out it bids fair to rival Williams' Creek in richness.

The news from Williams' Crcek is rather unfavorable, in consequence of the scarcity of water.

On Grouse Creek the flume company continues paying fairly.

COLORADO.

Central City *Herald*, Aug. 5th: William Monday & Co. are working the patch diggings on Quartz Hill with good success. Mr. Rohert Frazier and others have discovered a new silver lode on the head of Ralston Creek. At a depth of 20 ft., the ore assays $30 silver per ton. They are developing it, and consider it very valuable, as the ore can be raised with very little or no expense....Hope, Leighton & Co. have, at a depth of 40 ft., uncoverod a 3-foot vein of pay ore. Yesterday they let a contract for the driving of two levels, each 40 foot in length. They are running their ore in the Shirer mill. The last clean-up yielded at the rate of $240 gold per cord....Camphell & Hardin are running their claim on Illinois Bar. As yct they have not been able to reach bedrock....Rist & Co., who are working out the ground on Russell, cleaned up and returned last Friday, 17½ ounces, gold, the yield of a four days' run, five men shoveling up and two ground sluicing. The late flood did not damage their works....Capt. Dean & Co. are still mining on Grass Valley Bar, South Clear Creek, with very profitable results....Dougherty & Co. are working on the same hill, west of Dean & Co. They too, are succeeding well.

A. H. Owens brought down with him this morning 70 ounces of gold, the product of the Pleasaut Valley Gulch mine, for the week ending August 1st.

The Barrett Mining Co. is supplying the California Reduction Works with ore from the Winnehago lode.

We understand that several new discoveries have heen made of gold-bearing quartz lodes, up Missouri Gulch.

Warren Hussey & Co. have purchascd, thus far this week, 463 ounces gold, the greater portion of which were purchased in small lots.

The Narragansett mine, on the Gregory lode, will soon resume its former life.

Wright & Co. have heen har mining on Clear Creek during the season, and have met with great success. With the exception of two days lost in consequence of high water, they have kept steadily at work, employing eight hands, and have taken out au average of $20 per day to the hand for the whole season. They have, during that time, made some very large runs, and occasionally have gone as high as $50 a day to the man, and some weeks they have cleaned up as high as $1,600, gold.

Warren Hussey & Co. have on exhibition at their hanking house, a nugget weighing 108 pennyweights, 12 grains, taken out of Russell Gulch, on last Tuesday, by R. L. White. Also one weighiug 40 pennyweights, 12 grains, taken from the Pleasant Valley Co's claims, by A. H. Owens. In addition to the nuggct of Mr. White's, mentioned above, this gentleman cleaned up, the same day, 29 ounces, gold, as the result of that day's run.

Central City *Register*, August 6th: The Lexington mill has been running husy this week on ore from various mines....Mr. Young has been ohtaining excellent results from the ore of the Mercer County lods. Richard White sold yesterday 30 ounces of gold bullion from his gulch mines on Russell's Gulch. He is doing well....Parties on Quartz Hill have discovered what appears to he the continuation of the Eagle lode, and are taking out pay dirt and quartz of extraordinary richness. Several dollars to the pan are sometimes obtained.

The new mill on the Winnebago is running constantly, night and day, and is working very smoothly, without a break or stop. It has 20 stamps, and is crushing a large amount of ore. It is so arranged as to run the water over and over again, when winter shall come and render it necessary.

Instead of damaging Richard White's mining operations in Pleasant Valley, the storm benefited him to the amount of $100 hy washing away sand which lay on the surface. He was ahle to secure this by seeing the storm approach, and making preparations for it.

IDAHO.

Helena (Montana) *Post*, August 14th: Mr. Warren Whitcher arrived in town yesterday from Pen d'Oreille Lake, aud reports that great excitement exists in the western portion of the Territory concerning the discovery of gold in the Coeur d'Alene Mountains. The road is crowded with miners from Beartown to the new diggings. He was informed that the mines paid from eight to ten dollars per day to the man, hut did not ascertain the precise location of the new discovery.

MONTANA.

Helena *Post*, Aug. 14th: Last Chance Gulch, even in portions which have been extensivly mined, are still far from being worked out. Claim No. 5 above discovery, yielding for the week ending on Saturday night last, 13 ounces of gold. The claim has already been partially worked out, and is now being thoroughly mined by drifting.

At Hershfield Bro's. may be seen the result of the last clean up of the Union Mill, from Whitlatch Union ledge. Eight days run, whith 22 stamps, yielded $6,316 96 gold, and $109 24 silver, assayed and emelted at Molitor Bros.

The mining operations at Ten Mile Cresk, recently spoken of by us, were commenced yesterday. In the immediate vicinity of the claim now heing opened, prospects of from seven to ten cents to the pan have heen obtained at a depth of 20 feet, and rich deposits of gold are thought to lis upon the bed rock. Claims have been and ars being staked up and down the gulch, and a company formed. Ground may he eithsr represented by actual labor or by the payment of an assessment of $5 per week for the purpose of prosecuting the work in the main shaft.

Wm. Nowlan, recently from Cable, hrings with him 366 ounces of splendid retort, the result of the last week's run on Cable rock with 20 stamps, in the Nowlan mill. He reports that the ledge from which the quartz was taken still looks fine, and is heing energetically worked.

A ditch 12 milee in length is in process of construction from Divide Creek to Rocker City, and will supply 1000 inches of water to the latter placc.

Prospects of 21¼ cents to the pan have been obtained in a little sag tributary to Dry Gulch and making junction with it at the foot of the Hangman's tree.

The Deer Lodge *Independent* gives ths following: The Thomas Mill at Cable is to commence crushing on custom qnartz.... New diggings in the Deer Lodge conntry are mysteriously hinted at....Uncle Ben's Gulch, discovered this eummer, 20 milss southwest of Deer Lodge City, is paying well. As high as $500 per day has heen taken out to the string of sluicea. One company has averagcd $20 per day to the man since it commenced running....It is thought that the miners have, during ths past three years, been at work on false hed rock at Silver Bow. Parties recently followed the example of Taylor & Thompson, in Last Chance gulch, and sunk a shaft to a depth of 25 feet below what has been considered as bed-rock. At that depth splendid pay gravel was struck. and it is thought that the Silver Bow will all he worked over again on the lower level....John McMahan & Co. keep two string of sluices cleaning up after their hydraulic at Highland, and take out about $1,000 per day. One week ago they obtaiued a nugget worth $240.

NEVADA.

Humboldt.

Winnemucca *Argent*, Aug. 20th: At no time in the history of Humboldt mining has there heen morc well-directed labor put upon mincs, and in no instance that we know of is it heing done for other than purposes of permanent development.

Gold Run is to have a quartz mill right at the mines. The Golconda Co. have made arrangements with G. W. Holt, to remove his mill to a small creek near the Golconda mine, and it will reduce ore from that mine.

The Pioneer mill is now undergoing repairs. There are now about 800 tons Manitowoc and Arizona tailings in the reservoir, that will be worked as soon as the pans are properly repaired, which will be in a few days. These tailings yield as much as ordinary second class ore, and will bear a second working. The new mill keeps running day and night. Only the stamps are run during the day, and crush nine tons, as much as can at present be worked in the pans. The two new pans and large settler will be in place this week, when the mill will be run at its full capacity—crushing 15 tons per day.

Reese River.

Austin *Reveille*, Aug. 15th: Since the 1st inst., there has been received at the Manhattan mill for reduction, 275 tons of ore, the assay value of which is $128,427. On these various lots of ores, which were produced in his district and in the district of White Pine, advances have been made to the amount of $97,759; and as the sum of $30,000 only has been shipped, there remain $67,759 invested in the ores now in the course of reduction at the mill.

Aug. 17: We were shown yesterday by Mr. Detrees, several specimens of exceedingly rich quartz from the Atlanta and Leonora ledges in the country. The Atlanta ore is at least from 80 to 90 per cent. silver and gold—the former predominating. The Leonora is full of leaf gold; a seam or streak runs through the ledge, which exceeds in richness anything of the kind we have ever seen. The ledges are well prospected and show a continuous increase in extent and richness.

On Saturday evening six bars of bullion, valued at $5,718.83, were brought into the city from the Knickerbocker mill, near Ione, and deposited in the bank of John A. Paxton & Co.

Aug. 18th: Four bars of bullion, valued at about $5,000, were shipped to-day through the house of John A. Paxton & Co. These bars were the production of ore from the district of White Pine.

Aug. 19th: A lot of ore from the Rough & Ready mine, Amador district, has just been reduced at the Manhattan mill, with the following result: Two tons of first class gave a yield by assay of the pulp of $290 per ton; and 5½ tons of second class yielded at the rate of $81 per ton. The ledge of the Rough & Ready is large, and will produce great quantities of the second class ore.

During a late visit to the Manhattan mill we saw in the melting room, bullion enough in the crude state and in bars to place a reasonable man in a comfortable position for life. So fine a quality of ore has been reduced at the mill lately, that its daily product of bullion amounts to between $6,000 and $7,000.

The Buel North Star Co. is producing the richest ore in quantity that has yet been extracted from Lander Hill. Of the large lot of 100 tons lately sent to the Manhattan mill for reduction, the assays of the pulp averaged at the rate of $482 per ton. Two tons, which were specially assorted from the first class ore, gave the enormous yield of $2,700 per ton. This is an indication of the pockets or chimneys of precious silver ores which lie beneath the surface of Lander Hill.

Aug. 21st: Yesterday there were received at the banking house of Paxton & Co., two bars of bullion from the Knickerbocker mill, near Ione, and two bars from the Combination Co., of Belmont.

We saw at the Manhattan mill a lot of ore from the district of Cortez which will yield largely of silver. It was produced from the Garrison ledge, and was noticeable from its large proportion of its silver bearing galena. The yield of the ore being reduced at present gave pulp assays ranging from $425 to $450 per ton.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Aug. 19th: The patent blower at the Hale & Norcross mine has been started. It works well. It is one of Root's patent No. 3, and was manufactured by Keep, Blake & Co., Globe Iron Works at Stockton, Cal. A similar one has also been started into operation at the Chollar-Potosi mine.

The body of ore encountered in sinking the upper part of the winze in the Imperial mine is said to increase in extent and improve in quality as it is followed down.

A vein of water has been struck in the lower level of the Alpha mine.

Aug. 20th: Judge Baldwin, Sam Stewart, Mr. Russell, and other gentlemen of this city and Gold Hill, are engaged in working a series of very rich leads in the Pyramid Lake country, about six miles from the Central Pacific Railroad. The leads are likely to prove immensely valuable. They have located several parallel leads, the largest of which—supposed to be the mother vein of the group—is 25 feet in width. Three lots of ore from these veins have been worked at the Mariposa mill in this city, and the lowest yield was $40 per ton, while the highest (a lot from the mother vein) was over $200. The ore yields about an equal value per ton of gold and silver, but silver will probably predominate when the water level is reached.

Aug. 21st: For some days past there has been a gradual settling down of the Chollar-Potosi mine, on South B street.

The Belcher Co. have just received one of Root's patent blowers, and will at once set it to pumping a supply of fresh air into their mine. All the leading companies on the Comstock range will soon be using three fans, or blowers.

During the past week E. Rubling & Co. melted into bars and assayed in this city and Gold Hill, 81,457 ounces of crude bullion.

The total amount of bullion shipped from this city and Gold Hill during the past week, was 9,736 lbs., worth $228,958.32.

The Pacific 40-stamp mill has been thoroughly overhauled, a new and powerful engine put in, and will probably resume operations to-day.

Pretty much all the mills in and about Gold Hill are now running steadily, plenty of rock being furnished by our mines.

A large amount of rich ore is coming out of the Kentuck at the present time.

The Yellow Jacket Co. are developing some excellent deposits of ore in their mine. Persons who have lately visited it say that it looks better than in many months.

Aug. 30th: By a private letter received in this city yesterday, we learn that some very rich veins of gold bearing quartz have been found in the neighborhood of the Mammoth lead, Nye County. The leads are much richer than any that have heretofore been found in that vicinity, the ores containing a large amount of free gold.

Steele's Proprietary Preparations.—These articles seem to have won especial favor from a class of regular customers, whose requirements are fully answered thereby, and who really save money by the purchase of articles which do all and always what is required of them. The price of Steele'e preparations of magnesia, cough lozenges, glycerine lotion, wine of pepsin, and perhaps a dozen others, are not much above the worthless nostrums that find a forced and brief sale by extravagant advertising. Steele & Co. are located at Keith & Co's old stand, on Montgomery street, between Clay and Commercial. Their prescriptions, made from fresh drugs of direct importation, cost no more than at any other place, and are filled by proficients of many years standing in this branch of the trade.

Aquatic Velocipede. — M. Thierry, a French architect, has invented a velocipede for water travel. It consists of two hollow pontoons of wood, water-tight, 12 feet long, and pointed at each end, fastened together by cross-bars. The seat is in the center, and about two feet high. The paddle-wheel, three feet in diameter, is in front, and is worked by treadles. The rudders—one at the stern of each pontoon—are moved by lines in the hands of the navigator. It is said to move with great rapidity.

The Late Eclipse.—Telegraphic dispatches from Calcutta inform us that the eclipse of the Sun, which took place on Tuesday of last week, occurred under most favorable auspices for observation; hence we may reasonably hope for results of great interest to the scientific world.

Great Novelty.—A sewing machine for six dollars may excite surprise. But why not for six dollars? It is nearly worth the price to look at the latest novelty, the Hancock machine, which may be seen in operation at the salesroom, 109 Montgomery street. Fuller & Co., agents.

To the Unemployed.—The Pacific Publishing Company are constantly in receipt of new publications and old standard works, by the sale of which, good, active canvassing agents can clear ten dollars per day. There is money in it, surely.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Formation of Quartz Veins.

Editors Press:—In the new work entitled "Natural Wealth of California," by Titus Fey Cronise, I find the following statement: "In one of the auriferous beds, in the vicinity of Volcano, Amador County, a distinctly marked quartz vein occurs in the gravel, showing how recently veins have been formed." In view of its bearing upon the age, origin, and mode of occurance of metalliferous deposits, I deem such a fact worthy of more than a mere passing notice. I have seen small quartz veins which were unquestionably deposited from solutions of silica. The crystals were built upon the walls of the cavity, and as they enlarged and approached each other, they were interlocked and filled the cavity full and solid, while in other parts of the fissure the crystals adhered to the walls, and only partially filled the original cavity. Was the quartz vein above referred to of this character? Other quartz veins that are metal-bearing show evidence of having been filled with plastic quartz formed beneath. Some of them were evidently found since the soil, in consequence of the decomposition and disintegration of the country rock, had attained to nearly or quite its present depth. The surface soil having been more yielding than the protrusion of nearly congealed quartz, some veins rapidly increase in width from a few inches beneath to many feet in thickness, at or near the surface. Was the vein spoken of by Mr. Cronise of this description or character? Was the deposit composed of quartz gravel, or was it made up in part of the disintegrated country rock? What is the bed rock upon which the deposit rests or rested? If the vein appears to have been protruded, did or does the quartz overlie or displace the gravel near the surface? In short, the vein should be studied in place, and such of its peculiarities as have a bearing upon its origin and age more accurately described. I am led to believe that there are other localities along what is now the base of the Sierra Nevada, where quartz veins intersect ancient auriferous gravel deposits, or the more ancient overlying detritus.

F. A. Herring.

Forbestown, Aug. 19th, 1868.

P. S.—I am much pleased with the Aug. 8th number of the Press. Prof. Rowlandson's and Dr. Lanszweert's papers indicate a proper spirit of inquiry. Dr. Lanszweert says: "Every one concurs in the belief that alluvial gold has been derived, at some time or other, from lodes." I for one must dissent from that proposition, and shall attempt, at some future time, to show that if quartz veins are protrusions of quartz, originally in a state of fusion, that fact also implies an eruptive era of metalliferous quartz—that there is no stopping short of such a conclusion.

F. A. H.

[Written for the Mining and Scientific Press.]

The Lafayette Mine, Hunter's Valley.

The well known locality of Hunter's Valley is situated about five miles from Hornitos, on the road to Bear Valley, Mariposa County, and to the west of Bear Mountain. It comprises a succession of hills, valleys, ravines, gulches, and terminates in a series of chemisal hills, about three miles from Merced River. It is watered by two creeks, and by numerous springs, the water-shed being from the hillsides. The mineral belt which traverses the valley runs in a northeasterly direction.

The celebrated mine, now owned by Mr. Ghirardelli & Co., of your city, and upon which the principal work was done by the first company, is a 140-foot shaft sunk on the vein, and a 40-foot drift on each side of the same. At the depth of about 50 feet from this level, the company have started a drift along the vein on every fifty feet sunk, but the drift does not extend over 20 feet in length. Recently, Mr. D. Ghirardelli has given a contract for sinking the same shaft 60 feet deeper, the work to be prosecuted night and day. When he reaches about 200 feet in depth, he intends to start a drift from both sides of the bottom of the shaft, and commence a systematic development of the mine. The vein is located in talcose slate, the rock showing gold with plenty of sulphurets, yielding from $35 to $70 per ton in the mill. This promises to be the best mine in Mariposa County, as all the rock therein, as well as the rock in the neighborhood, carries more and more precious metal as depth is acquired. Mr. Mosheimer's assay of the ores of this mine is as follows:

No. 1—Average sample of quartz from the bottom of the shaft contains, per ton, gold, $192, silver, $4.80—$196.80.

No. 2—Concentrated sulphuret, gold, $216, silver, $15.40—$231.40.

No. 3—Tailings from the mill, gold, $1,006, silver, $48—$1,054.

No. 4—Crushed sulphurets, gold, $264, silver, $12—$276.40.

Great hopes are entertained on a more thorough development of the mine.

C. Lombardo.

Hunter's Valley, August 1st, 1868.

Important Inventions.—In the machinery department of the Pavilion will be found a new and improved gauging box for making shaved shingles; also, a new machine for beveling and tapering barrel staves, invented and patented by J. W. Alesworth, of Santa Cruz. These two machines are made upon the same principle, and consist of a box having false bottoms which are employed to regulate the width of the staves or shingles. The box for gauging and tapering barrel staves has removable strips placed on the top of its sides, which have the taper desired to be given to the staves. A strip of wood is placed in the angle formed by the false bottom and sides against which the stave to be beveled is placed, which causes it to stand at an angle inside the box. A number of boards intended for staves are thus placed and confined, when by following the taper of the supplemental sides with a drawing-knife, both the proper taper and bevel is given to them. Mr. Alesworth secures his patents through the Agency of the Mining and Scientific Press.

Encourage Home Industry.—California will soon become independent of the Eastern States, with regard to manufactures of all kinds. To this end every person should hold to the doctrine that it is the duty of our citizens to encourage and sustain each other in business. Patronize home manufactories, in all cases, when it can be done, even at a little sacrifice of convenience, if necessary. This is the only way to build up a community. Mutual aid and mutual encouragement is incumbent upon all, if all expect to prosper. Any other course is "penny wise and pound foolish." We have been peculiarly impressed, during the present Fair, at observing the vast number of branches of manufacturing industry which have been opened up in this State, and especially with the great increase which has taken place since the exhibition of two and three years ago. The past fairs of the Mechanics' Institute have been but too truly charged with being largely mammoth advertising concerns for foreign and Eastern productions; but the present is universally acknowledged to be a most creditable exhibition of home manufactures.

Where to Advertise.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low.

Gas-fitting and Plumbing.—The attention of our readers is called to the advertisement of Messrs. Hely & Cusick, house and ship plumbers, 914 Market street. As they are practical workmen, your buildings will be fitted up with gas, water and steam in the most approved style, and on very reasonable terms.

Excelsior—"Onward and upward"—the progress of the ladies' waterfalls.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

Notice.—The partnership of C. W. M. Smith, W. B. Ewer and A. T. Dewey, has been dissolved this day by mutual consent. The Patent Agency and Newspaper Business of the MINING AND SCIENTIFIC PRESS will be continued under the firm-name of Dewey & Co., by A. T. Dewey and W. B. Ewer.

San Francisco, August 1, 1868.

San Francisco:

Saturday Morning, Aug. 29, 1868

Notices to Correspondents.

YOUNG NATURALIST.—The number of species of living plants is estimated to reach 100,000. Of the animal kingdom, the sub-kingdom of radiates number about 10,000; of mollusks, 20,000; of articulates, 300,000; of vertebrates, 21,000; making a total in the animal kingdom exceeding 360,000 species. Of existing vertebrates, the number of species of fishes is about 10,000; of reptiles, 2,000; of birds, 7,000; of mammals, 2,000; forming a total of about 21,000.

SHAKER.—One of the most remarkable cases of an alteration in the relative position of water and land occurred at an earthquake which took place in the year 1819, where in the neighborhood of the Delta of the Indus, an area of two thousand square miles became an inland sea—the fort and village of Sindree sinking until the tops of the houses were only just visible above the water. Five and one-half miles from Sindree, parallel with the sunken area, a region was elevated above the Delta fifty miles long, and in some places ten miles broad. In 1838, the fort of Sandree was still half buried in the sea, and during an earthquake in 1845 the Sindree Lake was converted into a salt-marsh.

GERMANICUS.—Beer was invented by the Egyptians, and was called the Pelusian liquor, because it was first made at Pelusium, a city near the mouth of the Nile. The invention is supposed to have taken place about 1200 years before the Christian era. The intoxicating drink of the northern nations was formed from honey, and was known under the names of mead and metheglin, the latter bearing the same relation to mead that small beer does to XXX ale or porter. The climax of a Scandinavian warrior's glory and happiness was to drink mead from a cup composed of his fallen foe's scull.

CALENDS.—August, the current month, derived its title from Augustus Cæsar, by a vote of the Roman Senate; the previous month, July, having been so named by the same body in honor of his predecessor, Julius Cæsar; and in order to render the compliment equal in all respects, a day was withdrawn from February and attached to August, although by so doing the regular interchange of thirty and thirty-one days, established by Julius Cæsar, was thus disturbed.

DOG-STAR.—The most recent observations place the distance of Sirius from our planet at from 560,000 to 1,224,000 times the diameter of the earth's orbit, which latter is 190,000,000 miles; consequently, even taking only the minimum calculation as the correct one, it would make the total distance amount to 105,040,000,000,000, with a fair probability of amounting to not less than half as much more.

TIN.—The tin mines at Temescal (Cal.) are turning out very well.

[From the Mechanics' Fair Daily Press.]

Trial of the Standish Steam Plow.

On Saturday last, at 2 P. M., there was a noteworthy flow of citizens of a solid and influential character, towards the vacant lot on the other side of the Mission, near Bernal Heights. The cars came thither loaded with bronzed and intelligent looking people, and there were several dozen buggies on the road besides. Farmers and capitalists, representing different sections of the State, were assembling there, to canvass the merits of the Standish Steam Plow,—an entirely original invention as to principle,—which was announced to be put on its first trial in this vicinity, before the eyes of the money-making and farming world, and the critical judgment of the attendants, patrons, and judges of the Mechanics' Institute Fair.

The plow has been described heretofore. It is a locomotive adapted to land travel, with a hack frame, which may be raised or dropped, sustaining a series of vertical knives, that revolve around their respective shaft centers whence they derive their propulsion, and cut the earth into the finest particles, to a depth of six inches, and a width of twelve feet, as the plow goes moving on through the field.

A tractive power sufficient to drag a wide gang-plow through the soil, has never been attainable in any kind of plowing locomotive with satisfactory economical results; therefore, the only steam plow that has become an established success, is the one where a stationary engine is employed, and the plow dragged to and fro by means of ropes and pulleys. All this complicated machinery is rendered unnecessary by the Standish Plow, for the simple reason that the results aimed at are accomplished without the agency of so great an amount of traction; and therein consists the novelty and advantage of the California steam plow, over all other inventions of the kind that have ever been submitted to the test of trial.

The ground to be experimented upon was very dry and hard—baked to the brick-like consistency which is characteristic of most California soils in the hight of the dry season. It was level, but the plow had traveled over places in getting to it where it had to overcome five feet in twenty of rise; though it could not be expected ever to plow up a grade of more than one in ten. Its weight, with coal and water aboard, is about eight tons; and the engine is one of 24-horse-power.

As the wonder-inspiring machine advanced over the ground, doing its work of pulverizing the soil more effectively and more speedily than 500 men could have done it with picks and hoes in the same space of time, a host of visitors followed it up closely, and studied its operation, under the hem of a vast cloud of brown dust, which arose from the cutters, and was carried away before wind. In the wake there were individuals with sticks, probing down through the loosened soil, to ascertain whether the plow had really done its work efficiently, where the knives had necessarily cut, and cross-cut, every square inch of the ground passed over.

The result was one of general satisfaction. Plowing was done at the rate of about 20 acres a day; whilst in loose or moist soil it might have been done at the rate of 40 to 50 acres. The problem of saving muscle, in so thorough a tillage of the soil, by the substitution of steam, seemed to have been unequivocally solved. It was one of those events which may be noted as a mark of the progress of humanity, and whose significance, though suggested, can scarcely be realized at the time of its occurrence.

Some there were who objected to the operations of the plow on theoretical grounds—that it did not turn the soil. But the fact was evident that there was just as much of the top soil buried below, and as much of the subsoil brought to the surface, as was consistent with a thorough and even mixture of all the ground brought in contact with the knives. Weeds were not buried, but they were shaken up and left in the condition that the gardener leaves them in—lying around loose on the surface. Had they been plowed under, they would only have aided in drying out the ground on the top of them. This mixing of the soil, it is claimed by Mr. Standish, in virtue of actual experiments, has the effect to increase the yield of the land forty per cent. a result which he surmises may be owing to the fact that a rapid agitation of the soil electrifies it; and as it is also exposed to the action of the atmosphere, from which it is well known that the soil derives a portion of its fertilizing properties, the claim must be allowed to rest on a basis worthy of consideration.

Amongst the improvements suggested by experience are: that the plow may be reduced to about 5½ tons in weight, and made to be of a more compact and handsome appearance; that the sweep of the cutters may be reduced, with advantage, from three feet to two feet in diameter, and the number accordingly increased from four to six; the effect of which would be to plow more evenly, and to avoid throwing the ground into ridges in hard ground, a result observed in a portion of the work on Saturday, yet which could have been avoided by running the engine a little faster, relatively to the speed of the cutters. A thousand feet of travel per minute is all that the cutters will bear through hard ground without heating and losing their temper. That speed corresponds to about 170 revolutions per minute of the upright shafts which revolve the cutters. Each cutter reaches into fresh soil, ahead of the previous one, from two to six inches, according to the speed of the locomotive.

That the steam plow is not fairly open to the objections which have been made to it on the score of weight and bulkiness, will appear when it is remembered that it performs the work of thirty horses, which would weigh fifteen tons, not reckoning the weight of their plow; while the steam plow weighs less than eight tons. The area of the wheels touching the surface, is greater than that presented by the feet of the thirty horses, and there is, therefore, a greater capacity for buoying up the machine in loose ground.

A drawing for a new plow, with some contemplated minor improvements, may be seen at the steps on the left hand side of the entrance to the Art Gallery, at the Fair. A harvesting attachment, intended to replace the plow attachment, is also represented. This will cut a swath of twenty feet in width; and five men will harvest, thresh and sack, with it 40 to 50 acres a day.

The straw is carried forward to the fire-place, and about one-third of it is consumed for firing, the experiment of using it for that purpose having been sufficiently tried to prove it to be practicable. In this harvesting attachment the speed of the threshing cylinder can be regulated to suit the character of the grain, whilst that of the cleaning machinery is uniform. To prevent fire, gauze protections are supplied, as in the case of stationary steam threshers.

FOREMAN'S TYPE ECCENTRIC.—Among the many interesting exhibitions of inventive skill that divide a visitors' attention during an evening at the Fair, is the type casting machine, made and recently improved by Mr. Andrew Foreman, Superintendent of Faulkner's California Type Foundry. This class of machinery has heretofore cast only six sizes of type, but by the introduction of an eccentric, in place of the old cam and spring, sixteen sizes of type may be obtained from one machine, where before several were required, together with different sets of patterns for each, involving great expense. Nor is this the only advantage gained by the eccentric. The cut-off is so sudden and perfect that much harder metal may be used in casting small letters, an objection difficult to overcome, the hardness of metal rendering it porous and brittle. In fact, it was this obstacle, we believe, that suggested the simple device by which it has been overcome. The superiority of metal used, and of the machinery with which it is cast, produce a density of body in the Faulkner type that is not found in any other, and the durability of face is proportionately increased. The antimony and lead used at this foundry are obtained from our own mines on the coast.

LUCY & HYMES offer for sale from their wholesale house, 314 California street, all the standard brands of soap. Their facilities for manufacturing are such as to afford a reduction of prices to the trade, and at the same time give a superior article to their customers. The Excelsior Washing Powders are also the production of this establishment, and have become a favorite with the public. Their virtues are easily tested, and the amount of time and hard labor saved by their use would surprise the public were it expressed in figures.

Surveying Instruments.

Mr. John Roach, mathematical instrument maker, 522 Montgomery street, exhibits some very superior instruments of his own make, consisting of a solar transit, miner's compass, and an engineer's transit. This last named, mounted on its tripod, is a bronzed instrument, which is generally preferred to the bright lacquered work. The graduation on the limb is marked to half degrees, reading by two verniers on opposite sides to single minutes, which by reversing show complete coincidence. A careful examination reveals the fact that it is not the work of an apprenticed hand; but of a head and hand long experienced. It is noticeable for the stout and solid axis on which the telescope revolves, for the cone or dish-shape of the lower limb, and the firm centers on which it turns, as it rises from its tripod. We are informed that the axis, lower plate and centers are the parts most frequently injured, and which in consequence require the maker's especial attention. In this case, these weak points appear to have been well guarded against.

The miner's compass is complete with tripod, parallel plates and box, used for obtaining angles, magnetic courses and approximate levels, independent of local attraction. The angle of a shaft, sunk even perpendicularly, may be taken, which can not be done by the ordinary surveying instruments. This instrument should be in the hands of every captain of a mine, being particularly intended for underground work.

The solar compass, or solar transit, is a curious looking instrument; so much so that visitors at the Pavilion, even surveyors, ask "what is it, and what for?" The solar compass was invented in 1835, and underwent many changes and improvements up to 1851, when one was exhibited at the World's Fair in London, and awarded a premium medal by the jurors on Astronomical Instruments. This has, however, many improvements on that of 1851. The telescope, which transits on the axis for taking forward and backward sights, has a double nonius traversing over the graduated limb, and all the facilities for the general work of a large-size transit. The solar apparatus, with latitude arc, and declination arc, moved by rack and pinion, and clamped at the proper place, gives the true meridian at the very moment of observation, and may be used independently of the magnetic needle in bright weather; while on cloudy days the needle, with its known variation, can be resorted to for retracing lines previously run or detecting the lines of former surveys. The survey of government lands is generally made by this kind of instrument. One which has been in the hands of a surveyor, and been used in the field for over twelve months, can be referred to with satisfaction. All this work was executed in this city by Mr. Roach.

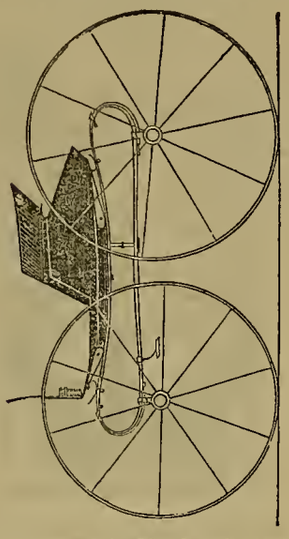
DENTAL IMPROVEMENT.—In the department devoted to dentistry, at the extreme left of the art gallery, we have examined, with considerable care and interest, a neatly arranged case exhibited by Dr. George W. Cole, recently from Portland, Oregon, and at present occupying rooms No. 14 Third street, in this city. Having taken out a patent last year for an improved mode of fastening a thin plate of gold, as a lining to the entire concave surface of the vulcanite plates in ordinary use, the Doctor has here placed some of the vulcanite plates, roughened by use and blackened with tobacco smoke, alongside of some beautiful specimens of the new work; thus showing, by the contrast, the superiority of the one over the other, much better than could be given by the most elaborate description. The advantages claimed for this improvement, in addition to those alluded to or readily occurring to the mind of the reader, are that it makes a thinner and at the same time a much stronger plate than the vulcanite. This style of plate admits of a very fine finish on the concave or plate surface. The secretions of the mouth are not so liable to adhere to the new plate as to the vulcanite; discoloration rarely if ever being produced by attendant acids. Vulcanite being a non-conductor of heat, produces an unnatural warmth, often inducing inflammation; while gold, being a good conductor, has a tendency to keep the mouth cool and to prevent all irritation.

[From the Mechanics' Fair Daily Press.]

Stretch's Map of the Workings on the Comstock Lode.

A finely executed lithographic map, drawn by R. H. Stretch, M. E., late State Mineralogist of Nevada, showing the workings in the Gould & Curry, Savage, Halo & Norcross, Chollar-Potosi and Bullion mines on the Comstock lode, 2x5 feet in dimension, has been published by Britton & Rey, which is the most valuable contribution of the kind that has yet appeared on the coast, illustrating the status of extensive underground operations. Such maps are exceedingly valuable to stockholders and to all interested in the mines represented, as they convey a better idea of the actual condition of things than could be obtained by crawling through the levels and shafts; and they are absolutely necessary for the engineering calculations constantly required from and made by intelligent superintendents. The works are shown from the beginning up to July, 1868; and the map was compiled from actual surveys made by Messrs. Stretch, James & Mason, so that it may be depended upon as reliable. The depth of each level is noted as regards its own shaft, and with reference to a common datum point for convenience of comparison. Red, green, blue, violet, yellow and brown colors are made use of to indicate levels of different depth to the eye, at a glance. The map is divided up by fine lines into squares of 100 feet each, affording a convenient scale for the determination of horizontal distances underground. In appearance it is handsome and workmanlike, but plain and unornamental. It may be had at Gensoul's, in this city, or at Lillie's, in Virginia City. Having been lithographed on good paper, any additional workings can be drawn upon it as they are done, without detriment to the general appearance.

A similar map on a larger scale, of the Chollar-Potosi mine, also by Mr. Stretch, may be seen on the walls of the front gallery at the Fair. It is more ornamental, and much larger; and is enhanced in value by the addition of front and side elevations, —which were omitted in the present map probably for the purpose of avoiding an inconvenient increase of size that would have been necessary. The Potosi, Chollar, Bajazette, and new shafts, are all shown, and the timbering is indicated by square subdivisions.



Important Railroad Invention.

The great objection to American railroads and railroad engineering, which one constantly bears talked about abroad and discussed with shuddering, is the frequency amongst us of dreadful railroad accidents; and it cannot be denied that the American railroad traveler on many of our roads takes his life in his hands, and commits it to the gods whether his body shall be mangled and torn, or whether he shall come off with the loss of a limb, or whole and rejoicing at his journey's end. A little invention by Dr. Beers, is on exhibition at the telegraph stand to the right of the fountain, which seems to be of particular merit in this respect, and which, if practicable, will prove the Americans to be equal to the emergency; as it promises to secure perfect safety of travel on the bad roads, which are admitted to be excusable only on the plea of long distances through new and unsettled countries. At dangerous places on the road, Dr. Beers proposes laying a middle rail, similar to the ordinary T rail, which is caught, under the flanges forming the top of the T, by two horizontal friction wheels, one on each side, fastened to the bottom of the car, and which run along without necessarily touching, except when the car springs up; making it thus an utter impossibility for any car to run off the track. The device is so simple, inexpensive and apparently practical, that it would seem probable of being brought into practical use on such stretches as the Oakland piles, or on exposed curves in the Sierra. The endings are pointed so that the car would take its hold on the safety-rail, and cling to mother earth at dangerous places, without requiring to be looked to in any manner by the engineer of the train. We are informed by Dr. Beers that no similar device for the accomplishment of the same purpose, has ever been proposed, or patented before. A middle rail has been used, however, on the Mount Cenis Railroad for the purpose of climbing, the horizontal wheels being, in that case, set in motion by the engine and caused to serve as climbers by virtue of friction.

A Mammoth Carriage Manufactory.

Geo. P. Kimball & Co's carriage manufactory, occupying an entire 100-vara lot on the corner of Fourth and Bryant streets, in this city, is believed to be the largest building on the Pacific Coast. In order to form a faint conception of its dimensions, we would state for the benefit of the reader, that it has a total of floor-room (not including 225 feet square in the yard) of 86,000 square feet, or 19,000 more than the Mechanics' Pavilion.

The lot on which the building stands is valued at about $100,000, and the whole cost of buildings and machinery amounts to about $150,000. In mentioning these works, the *Daily Alta* says: This structure

was commenced in March only, and although the rain, scarcity of material, and delays of various kinds absorbed twenty days of the period between its commencement and its completion, less than three months have sufficed to erect a structure that does honor to our State, and exhibits a confidence in its future that cannot but result most favorably in a pecuniary point of view. Of late, California manufactured wagons have been much more popular than the imported, as they are better adapted to the requirements of the country, and the business has increased in proportion to the growing wants of an increasing community.

Messrs. Kimball & Co. are widely known throughout the State, and their wagons are like household words. About one year since they conceived the idea of a combination of the principle of the perch-spring and thorough-brace—the perch and spring being one piece, and steamed and bent, forming a curve, over which the thorough-brace passes, and upon which the body of the wagon rests, an illustration of which is herewith given. They also substitute a steel plate for the usual heavy axle, thus lessening the weight of an ordinary wagon 33 per cent. The experiment has proved a great success, and Messrs. K. & Co. having received their letters patent for these improvements, determined to increase their facilities for manufacturing equal to the demand; for this purpose they have erected a manufactory unequaled on this coast, and perhaps not excelled in the United States." Having already mentioned the fine display of this firm in the Pavilion, we will add, in conclusion, that they are employing about 200 men in their business, and are turning out per month, in addition to other work, 100 C spring thorough-brace buggies, and have orders for four months ahead.

"If men or women could but find the fabled fountain which is said to restore health, and strength, and beauty, with what eagerness they would rush to to drink its waters." It is found in the S. T.—1860—X. The sale of the Plantation Bitters is without a precedent in the history of the world. They are at once the most speedy, strengthening health-restorer ever discovered. It requires but a single trial to understand this. *

Celebrated Blacking.—More songs have been composed and sung upon the virtues of boot-blacking and excelsior soaps than on most any other theme, save that of love and romance; but they seem, after all, to have portrayed all the virtues that belong to Anstin's celebrated California manufactured oil paste polish, which appear to possess a freshness and ease of polish which the other brands seem to have lost by transportation. J. Bray, at 416 Battery street, is agent for this and all other kinds of valuable blacking that is offered to the trade.

The *blind* made to *see* (almost) at the spectacle emporium of C. Muller, 205 Montgomery street—the place to get your spectacles. *

We learn that a refreshment saloon, to be conducted on the European plan, was opened last week in a large ornamental building just completed at Woodward's Gardens, under the supervision of Mr. Habermehl. *

Wanted—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

Notice.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E, in another column.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-atm

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instant-
ly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 652 Market street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.

To Capitalists and Mining Men.

The undersigned, President of the OLOBE GOLD AND SILVER MINING COMPANY, located in Monitor, Alpine County, Cal., (capital $650,000) and owner of a controlling interest, (two-thirds) wishes to negotiate for a LOAN to continue the work of development, now in progress, during his absence in New York, whither he proposes to sail on the 5th of September, for the purpose of raising necessary working capital (by sale of ten thousand shares of unassessable stock, appropriated for that purpose) to erect reduction works, etc. Or would sell an interest at a price that would insure a very large and immediate profit, simply as a speculation. Maps, reports, etc., and all other information, on application, from 9 A. M. to 12 M., or 2 to 5 P. M., at my room, 735 Green street, first cottage in the alley.
9v17 J. WINCHESTER.

Support Home Manufactures.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
HOSE AND TAPE FUSE,
A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

13v12 **President.**

J. M. HAVEN,

ATTORNEY AND COUNSELOR AT LAW

Room 25 Montgomery Block,

27v16 SAN FRANCISCO.

THE AMERICAM SPRING BED.—As a substitute for the costly, clumsy, rickerty, spiral-spring beds in general use, we hail this invention as an innovation of more than ordinary consequence. The springs are independent of the mattress and not likely to get out of order; but in case they do, any one can repair them at a trifling expense. It is portable, durable, and therefore convenient. The writer has used one of these beds for several months, and is more than satisfied with its action. It is easily fitted to any ordinary bedstead at a total expense of about four to seven or eight dollars only. G. W. Kinzer is agent, under Mechanics' Institute, and the bed is among the new and attractive inventions on exhibition in the Fair. We are sure no one will ever return to the old style of springs after a fair trial of these.

GOLDEN RULE EMPORIUM.—This is the trade-mark of Geo. Thakrah, the extensive dealer in men's furnishing goods, fancy articles, etc., 59 Second street. Those who have not called on Thakrah, have failed to form an acquaintance with one of the best and cheapest stock of goods in the city—the best goods at the lowest prices.

THE MODERN BELLE.—Jones says the reason why young ladies are called belles, is because they have so much brass in their composition,—make so much sonnd,—and have clappers which strike as they go up or down. Our lady friends must remember that Jones is a miserable old bachelor, or he would not publish such a libel on them.

CARRYING A JOKE TOO FAR.—A fellow was caught the other evening with half a dozen pair of knitted socks, which he had taken from one of the stands at the Fair. When arrested by the officer, he said he only took them as a joke. As he had taken them outside of the Pavilion, the officer said that was carrying the joke too far. The joker is now in the calaboose.

ARE THE
Fashionable Clothiers
OF
San Francisco.

SPECIALTIES.
PRICE AND GUARANTEE.
The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Bags and Valises, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of piece goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.

STYLES.
Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.

GOODS MADE TO ORDER.
For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc., made to order at short notice.

COUNTRY ORDERS.
Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

Physician and Surgeon.
H. G. COSGROVE, Superintendent. 21v16-3m

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer.
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

Mining Secretary.
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.
J. M. BUFFINGTON.

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm

FRENCH PROVIDENT SAVINGS AND LOAN SOCIETY.—The semi-annual statement to July 1st, makes quite a gratifying showing to those interested in its success. The interest and premiums received during this time were $171,499.34; the sinking fund amounts to $67,711.99, an increase of $8,907.05. The Auditing Committee report as follows: That during the six months just closed the Society have received deposits to the amount of one million dollars. Its capital has increased three hundred and sixty thousand dollars, while five hundred and sixty-seven new members have been entered on its books. The profits amount to over one hundred and seventy thousand dollars. These results attest the success of our Association.

The clear and simple manner in which the accounts of the Society are kept have greatly facilitated our duty of auditing. The books are balanced and certified each month by the Financial Committee, and we have, in fact, only had to follow in their footsteps.

All the securities of the Society are in the hands of the Treasurer, and preserved in good order. The business of the Society is well ordered and administered in every respect. We recommend, therefore, gentlemen, that the etatement and accounts eubmitted be accepted, and that a resolution of thanks he voted to our officers for their faithful attention to the interests of the Society. Signed, H. Barroilhet, merchant, G. Venard, merchant, F. Berton, hanker, C. Tence, merchant, A. Bona, merchant, Auditing Committee.

The office of this Society is at 533 Commercial etreet.

THE CALIFORNIA LAUREL WOOD.—This beautiful wood, which is rapidly coming into favor as a material for the manufacture of furniture and ornamental articles, owing to its peculiar color, will eoon he extensively used for covering walls of the interior of the residences of the wealthy—as a substitute for paper. It is a well known fact that the colors of this handsome wood are those best adapted for the display of elegance "under the gae light"—forming a charming neutral tint, which eoftene the glare of intensely bright colors and increases the depth of those beautifully subdued hues prepared from analine and kindred subetances. The magnificent log of this wood exhibited in front of the Fair building, if cut into veneere of the thicknees of the recently introduced wall woode, would cover the entire eurface of the mammoth pavilion. It is scarcely possible to conceive a more elegant eight than its interior would present were it thus veneered and polished in the best style, with the countless gas lights reflected from its sides. The day is not far distaut when many of our finest public and private halle will he thus adorned. As the expense will he much less than is generally imrgined—and the work if once well done would last for ages—we predict a great future for the California laurel wood.

THE FLORENCE

RECEIVED THE HIGHEST PREMIUMS

At all the most important Fairs held in the United States in the year 1867. Gold Medals at the American Institute Fair, New York; Mechanics' Association Fair, Lowell; Maryland Institute Fair, Baltimore. Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; aspirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

Committees to Award Premiums.

A number of additional Committees have just been announced. The full list, as far as appointed, is as follows:

CLASS I.

SEC. I. *Steam Engines.*—Wm. Burnett, Montgomery Fletcher and John Bermingham.

SEC. 2 *Motive Powers.*—Joseph Moore, Wm. McKibben and Geo. K. Gluyas.

CLASS II.

SEC. 1. *Machinery for Working Metals.*—R. P. Brunner, D B. Hinckley and John Lochhead.

SEC 2. *Machinery for Working Wood.*—D. A. McDonald, C W Thomas and Wm. N Miller.

SEC. 3. *Agricultural Machinery* —C. L. Low, Horatio Stebbins, W. C. Bartlett, Samuel Dinsmore and R. B. Woodward.

CLASS III

DIVISION 1. *Machinery for Mining, Tunneling, Metallurgical Processes, Crushers, Pulverizers, Amalgamators and Concentrators* —Wm Ashburner, Melville Atwood and James Brodie.

DIVISION 2 *Pumps, Hose Pipes, Nozzles, Pipe Couplings, Apparatus for Burning Petroleum and Steam Fuel.*—D. K Hayes, Charles Elliott and George Hogg.

CLASS IV.

Naval Architecture.—A. T. Fletcher, Captain Cox and A M. Westervelt.

CLASS V.

Military Engineering, Fire-Arms, Powder and Matches.—Major Elliott, Isaac Bluxome and J. J. Haley.

CLASS VI.

Civil Engineering and Architecture.—George Gordon, H Cleaveland and Col. Bulkley.

CLASS VII.

SEC. 1. *Philosophical and other Instruments.*—Sherman Day, Wm. Schmolz and Herman Shussler.

SEC. 2. *Surgical and Dental Instruments and Productions.*—Dr. James Blake, Dr. Austin and Dr. C. C. Knowles.

CLASS VIII.

Steel and Iron Manufactures.

SEC. 1. *Plain and Ornamental Goods, Stoves, Safes, Wrought Iron and Blacksmithing* —I. M Scott, Wm. McKibbin, Charles Steiger, J. R. Sims and J. G. Ills

SEC. 2. *Tools, Hardware, Cutlery, Locks and Wire Work.*—B F. Dunham, A. A. Louderback, W. S. Phelps, J. McGill and John Dixon.

SEC 3. *Castings of Brass, Tin, Lead and Compositions, and Brass Finishing* —J. M. Eckfelt, J. W. Brittan and W. W Montagne.

SEC. 4. *Copper Stills, Worms, Lead Pipes, Shot, Plumbing, Gas Fitting and Tin Ware.*—Melville Atwood, Thos. Day and W. S. Snooks

CLASS IX.

Glass, Pottery, Etc.—W. B. Ewer, James Harris, R. H. McDonald, N. P. Langland and Isaac E. Davis.

CLASS X.

Wood and Wood Work.—Jamca Easton, B. H Freeman, N. P Langland, Wm. Gunn, P. M. Bowen and T. F. Neagle.

CLASS XI.

Minerals.—W. B. Ewer, O. W. Easton and — Deetkin, of Grass Valley.

CLASS XII.

Chemistry and Chemical Substances—Comprising all chemical and pharmaceutical manufactures, as alkalies, acids, and all other manufactures and processes.—James Blake, D. C Bertody, Thomas Price, Archibald Cooper, and E. T. Martin.

CLASS XIII.

Jewelry, Silver and Plated Ware.—Robert C. Rogers, B. P. Avery, and Job M. Semans.

CLASS XIV.

Lithography, Engraving, Printing, Book-Binding, Paper, Type and Penmanship.—Jacob Bacon, J. J. Rey, E. Bosqui, H. H. Moore, and C. Beach.

CLASS XV

Carriages and Wagons.—H. M. Newhall, John W. Farrau, and H. W. Byington.

CLASS XVI.

Leather and Leather Work—Divided into three sections, as follows: Section One—Comprising harness and saudlery.—W. H. Baxter, J. B. Dorr, and Josiah Davis. Section Second—Boots and Shoes.—F. McCrellish, T. H. Hayes, and J. B. Roberts Section Three—Hose, trunks, valises, carpet bags, buckets, and fire caps —William Sherman, W. S. Phelps, and F. E. R. Whitney.

CLASS XVII.

Sign, House, and Carriage Painting.—Charles Hopps, Henry Keutzer, and Charles Nahl.

CLASS XVIII.

Furniture, Billiard Tables, Desks, and Upholstery; Including work for amusement.—James Easton, A Conrad, Charles M. Plum, George T. Grimes, J. O. Eldridge, E. S Spear.

CLASS XIX

Stone Cutting and Marble Work—Comprising imitation stone work, polishing powders, sculpture, etc.—Lewis Larsimer, F. Williams, William Pallen, Joseph Britain, B. B. Moreton.

CLASS XX.

Oil, Soap, and Candles.—R. H. McDonald, John Wigmore, J. R. Deane, William H. Swain, and L. B. Dell.

CLASS XXI.

SECTION ONE—*Painting and Drawing.*—M. S. Latham, B. P. Avery Noah Brooks, Robert C. Rogers, F. L. A. Pioche. Section Two—Photography.—J. J. Rey, J. H. Barry, J. R. Jarhoe, J. Mora Moss, J. B. Walmesford.

CLASS XXII.

Musical Instruments.—R. Herold. Carl Rosa, George Pettinos, Washington Elliott, and T. E. Grath.

CLASS XXIII.

Woolen and Cotton Manufactures.—Peter Thompson, Jonas Alder, A. Austin, C. J. Janson, William Sherman, H. N. Miller, F. Henderson.

CLASS XXIV.

Fur, Clothing, Hats and Caps.—W. T. Copeland, C. A. McNulty, —— Lockwood, —— Nickerson, —— Bridges.

CLASS XXV.

Silk and its Manufactures.—John C. Whiteman, George Huntsmann, L. Sachs.

CLASS XXVI.

Sewing Machines and Needlework.—Mrs. Capt. Connor, Mrs. Henry Carlton, Mrs. P. Caduc, Mrs. H. M. Newhall, and Mrs. J. B Harmstead.

CLASS XXVII.

California Wines and Brandies.—C. A. McNulty, Ralph Emerson, Ogden Hoffman, J. Mora Moss, Henry Kenitzer, Dr. Carl Precht, A. J. Bryant.

CLASS XXVIII.

Horticulture, Agriculture, etc.—Peter Gilmore, H. K. Cummings, C. J. Pilsbury, D. S. Graves, and Nathaniel Gray.

The Committee on Classes Twenty-nine and Thirty, the first being on substances used for food and the latter on miscellaneous articles, were not appointed in time for the present issue.

"WE STILL LIVE," say the proprietors of the Standard Soap Company's Washing Powder; and those families who use it hope they will live to reap a full reward for the useful invention, and live many years after to enjoy their good fortune. Only a few years ago washing was really a dreadful thing in almost every household, but with such modern appliances of washing-powders and clothes-ringers, the drudgery of washing has been essentially played out. There are, however, a few families who still adhere to the old method. To such we say try the Staudard Washiug Powder, and be the slaves of useless labor no more.

LET HOME INDUSTRY BE PATRONIZED.—The San Francisco Brush Factory, Sacramento street, was established about 18 months ago. At that time, we well remember, the proprictors hoped to he ahle to turn out some 200 dozen brushes per month of a better quality and at lower rates than the imported. Jndging from their fine display in the Fair, as well as at that large storerooms, they must have realized their most sanguine expectations. We here find hat brushes, blacking brushes, clothes brushes, scrubbing brushes, printers' brushes—brushes of all sizes, sorts and shapes, of every variety and made of all the different material used for such purposes. The fiber of the soap-root, which is found in great ahundance on this coast, has been called into requisition and turned to good account, more particularly as a scrubbing hrush. All who believe in encouraging home manufactures, (and who does not?) should hy all means give them a call.

What they are;
How Assayed;
How Concentrated;
And How Worked;

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.--Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

ATTENTION.—Virginia City, Aug. 9th, 1868—Dewey & Co., San Francisco.—Gents:

The Patent, enclosing your favor with Inventor's certificate, etc., came duly to hand, and for which please accept my grateful acknowledgements.

I am pleased to learn that the business of your agency for Patents, etc., is rapidly increasing. This is as it should be. Your promptness, fidelity and skill, as Patent Agents, entitle you to public confidence and patronage.

I can see no good reason why Inventors on the Pacific Coast should employ agents in New York and other Eastern cities to transact their business at the Patent Office, when we have among us those equally qualified by long study and large experience.

Yours, truly, J. A. C.

Subscribe for the New Volume of the Mining and Scientific Press.

The proprictors of this jonrnal will undertake to make the Seventeenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st 1868), superior in many respects to former issues.

It will be printed on extra quality of paper, rendering it a handsome volume to file for future use.

An increased amount of editorial labor will be expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations will be given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number will treat carefully on subjects of home trades, manufactures and domestic economy

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetings, assessments, dividends, sales, etc.

"Answers to Correspondents" afford much of interest to readers and of advantage to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The PRESS was established in 1860, and as a mining and mechanical journal has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of August, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary

Any stock upon which said assessment shall remain unpaid on the twenty third day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twelfth day of October, 1868 to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. au22

Chipioneta Mining Company.—District of Ures, Sonora, Mexico.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the ninth day of July, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Buzzolini, D.	11	30	$150 00
Buzzolini, B.	72	4	20 00
Chevereth, E.	22	1	5 00
Ghirardelli, D.	23	29	145 00
Ghirardelli, B.	72	91	450 00
Ghirardelli, B.	75	20	100 00
Mosheimer, Jos.	86	25	125 00
Mosheimer, Jos.	87	26	130 00
Smith, R.	86	5	25 00
Quin, Thos	85	5	25 00

And in accordance with law, and an order of the Board of Trustees, made on the ninth day of July, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by John Middleton & Son, No. 310 Montgomery street, San Francisco, California, on Monday, the thirty-first day of August, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. au15

Office of the Folsom Street and Fort Point Railroad and Tunnel Company, southwest corner of Montgomery and California streets, Room No. 16, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of July, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to Caleb T. Fay, Esq., at the office of the Company.

Any shares of stock upon which said assessment shall remain unpaid on the twenty ninth day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourteenth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

aul JOS. M WOOD, Secretary.

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of July, 1868, an assessment (No. 25) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 523 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Thursday, the tenth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth (5th) day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 523 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. aul

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpina County, California.

NOTICE.—The Annual Meeting of the stockholders of the I. X. L. Gold and Silver Mining Company, for the purpose of electing Trustees for the ensuing year, will be held at the office of the Company, Pioneer Hall, Montgomery street, San Francisco, Cal., on THURSDAY, September tenth, 1868, at 2 P. M.

au15 J. CROWNINSHIELD, Secretary.

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. au8

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of August, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, up stairs, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

8v13f SAN FRANCISCO.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAO IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Missiou st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump. Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 2tv16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **$600**

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... **850**

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

HO TEAMSTERS!

CONTINUE TO

USE HUCKS & LAMBERT'S

CELEBRATED

H & L Axle Grease,

To which you have given so decided a preference for the last

FOURTEEN YEARS,

It is the only reliable article

IN THE MARKET

Every care will continue to be used to sustain the high reputation the H & L Axle Grease, has so long and justly attained.

☞Be sure and ask for the H & L brand, and see that the

TRADE MARK H & L

IS ON THE COVER OF THE PACKAGE

NONE OTHER IS GENUINE.

FOR SALE IN EVERY STATE IN THE UNION.

FOURTEEN YEARS' EXPERIENCE has proven to all who have tried it the superiority of Hucks and Lamberts's Axle Grease, the trade mark of which has become familiar as a household word wherever man rides or wagons run. Like its inventor, it is a thorough-going article—the same thing every time. No imitation has yet approached it, though its extensive sale has induced many attempts in that direction. Its first appearance was hailed with joy by teamsters everywhere, and its continued and universal use would seem to indicate it to be their "joy forever."

TRUEWORTHY.—Like his namesake who "figures" so familiarly in the old school-books, our whilom friend, F. M. Trueworthy, the cutter of stencils and brands, is always an exact man, and when entrusted with a job, its excellence always gives satisfaction for the price you pay. We do not know that his charges are higher or lower than others, but we speak of his work as an admirer of chaste exections in lettering of all kinds.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTROOUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks: a small, inexpensive stationary key is alone required at each station By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLO AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The OETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

J. E. BUERK, Proprietor,
47 Congress street, Boston.

SQUARZA'S PUNCHES

—AT THE—

MECHANICS' INSTITUTE FAIR.

CHALLENGE

To all Punch Manufacturers

IN THIS STATE FOR

ONE THOUSAND DOLLARS

That the Punches manufactured by the undersigned are of better material, better made, and of superior flavor to any Punches that are fabricated on this coast.

The Punches of Squarza are world-renowned, and have been distinguished by receiving THIRTEEN PREMIUMS at the different Fairs in this State. The following is a list of the Celebrated and Favorite.

Squarza's Punches and Cordials

which will be on exhibition at the Mechanics' Institute Fair, where visitors from the interior can try the various brands:

Welcome,	Strawberry,	Mint,
Jamaica Rum,	Pisco,	Anise,
Cognac,	Appetizer,	Blackberries,
Arrack,	Anti-Dyspeptic,	Rose,
Kirschwasser,	Roman,	Kiminel,
Gin,	Nectar,	Pus Coffee,
Whisky,	Ladies' Tears,	Kirsch
Cocoa,	Anti-Divorce,	Ladies' Pleasure,
Coffee,	Aurora,	Morning Comfort,
Tea,	Farewell,	
	Pine Apple,	

In addition to the above well known beverages, the undersigned has the pleasure of introducing for the first time

THE ECG NOG PUNCH,

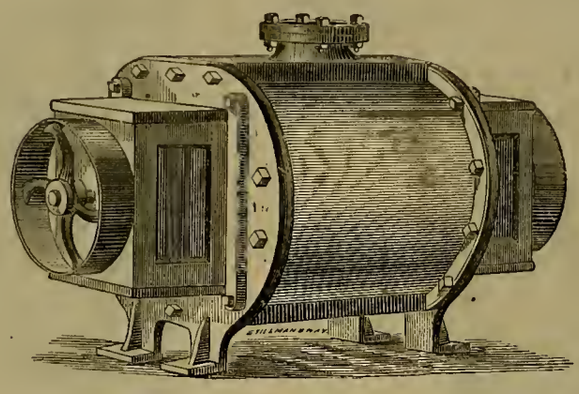
A drink with all the flavor and invigorating qualities of this popular decoction, which can be bottled and kept like any other Punch. Also the

LADIES' FAVORITE,

A mild and highly-flavored Cordial for the Ladies; both of which are preparations by Squarza.

There will also be on exhibition the celebrated brands of Bitters made by Squarza—the

Hygienic Bitters, Cholera Antidote, Agusturo, Seisner.



All these liqueurs have ripened and mellowed with age, having been manufactured from five to seven years ago by Squarza himself.

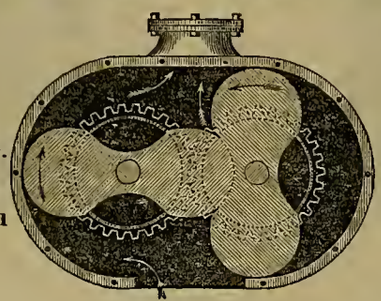
Successor to V. Squarza,
National Manufactory, 120 Leidesdorff street,
Bet Sacramento and California, opp. What Cheer House

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR

Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission und Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

4v16 3m

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

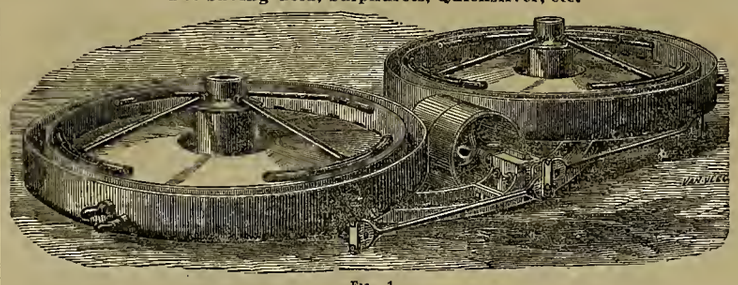


FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

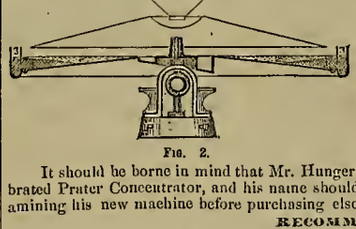

FIG. 2.

Fig 2 is a section through the center of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

NEWCASTLE, Cal., June 21, 1868.

M. HUNGERFORD, ESQ.—*Dear Sir:*—Having used eight of your improved Concentrators (built by Goss & Lambard, of Sacramento), it affords me pleasure to hear testimony to their efficiency and adaptation to the purposes for which they are designed. I have used various styles of Concentrators during the last five years, but have found nothing that begins to compare with your machine, for durability and thorough concentration; and I can confidently recommend them to millmen, being, in my opinion, the best Concentrator now in use. Yours truly,

J. C. COREY.

NEWCASTLE, Placer County, Cal., June 23, 1868.

Mr. MORGAN HUNGERFORD, ESQ.—*Dear Sir:*—After witnessing the operation of eight of your Concentrators for a month, in the Golden Rule mill, Placer County, and running the same number in the Mt. Pleasant mill, El Dorado County, I am satisfied they are superior, as Concentrators, and more durable and less liable to get out of order, than any Concentraters I have seen; and I recommend them to millmen, feeling assured they will, after the most thorough trial, be pleased with them.

Very respectfully,

L. E. ATCHISON, Metallurgist.

BIG OAK FLAT, May 23, 1868.—*Mr. Thos. Mulford*—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do.

E. M. SMITH, Supt.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco.

In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, $300

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoannt Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

$100 A MONTH SALARY WILL BE PAID FOR Agents, male or female, in a new, pleasant, permanent business. Full particulars FREE by return mail, of sample, retailing at $4 50, for 50 cents. A. D. BOWMAN & CO., No. 4 Broad street, New York.

[Cut out and return this notice. 6v17 7t

Gold Mining--Quicksilver vs. Melted Zinc.

Successful gold mining comprises the possession of sufficiently rich gold quartz to pay for extraction and working, and the ability to extract the gold from the quartz economically and perfectly, in as few operations, and with as simple machinery, as possible, requiring the presence of only such conditions as are anywhere at hand.

When we fairly examine the retentive faculty of quicksilver for gold, we find it very limited, indeed;—that the affinity acts only on the perfectly pure surface of both—a minority of cases in reality—and that a reduction in temperature so greatly reduces the affinity, that it hardly exists below a temperature of 42° Fah. The result is that, on an average, only one half, or thereabout, of the gold is extracted by quicksilver from the ore; the rest is either carried away as float-gold, by the water required for the batteries, or remains in the tailings. This fact, known to every intelligent operator, should alone be sufficient to point out the imperative necessity of devising other extracting agents for that great majority of ore, containing more than $20 to $25 per ton; but not rich enough to leave a profit by direct chlorination. Concentration of the sulphurets, for chlorination, involves at best a great loss in float-gold. Many localities, with rich quartz veins, have insufficient water for batteries within convenient distance, and for the greater part of the year the ore has to be hauled long distances, with heavy expenditure, to a mill-site with water, or the mine must be abandoned and lie idle.

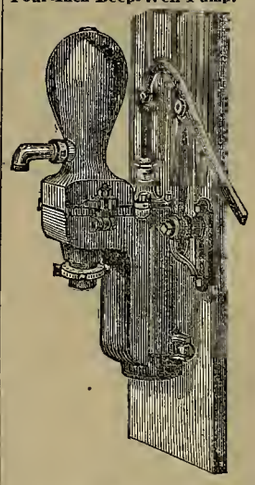
The case therefore stands thus: What is required, is an extracting agent, that does the work complete, cheapor than chloride, and requiring no water to reduce the ore, except such as is needed for the engine.

Zinc, of all substances in existence—chloride not excepted—has the greatest affinity to gold. Its action, in a melted state, on gold, is to instantaneously dissolve the same in any proportion. Its specific gravity—about 7—is sufficiently high to float all debris, not excepting sulphurets of iron, the constant companion of gold. It melts ot a comparatively low temperature, and requires but little heat to retain its melted state. It is sufficiently volatile to permit of retorting, as in the use of quicksilver, but by a covered surface and a temperature helow a dark-red heat, the loss by volatilization and hurning is hardly appreciahle, while the metal is obtained at a low price and in any quantity required. Thus we have in *zinc* a material manageable and fulfilling the conditions required of a gold-extracting agent in a high degree—higher than any other known.

The mode of applying it for this purpose was patented, April 7th, 1868, by the undersigned, for many years engaged in gold mining. It consists simply in gradually introducing the gold-bearing pulverized substance, below the surface, into a bath of melted zinc, which will immediately attack and dissolve nearly or every particle of gold, while the debris rises to the surface to he taken off. The mechanism is very simple and durable. Should sulphurets, in which particles of gold are so firmly imbedded as not to offer any contact even on the smallest point, prevent the extraction to such a degree, that it will pay to work it over by conceutration, roasting and chlorination, it may be done. But all the gold, in another manner lost as float-gold, and much more, is certainly already saved by the zinc. Dry crushers to be used iu preference.

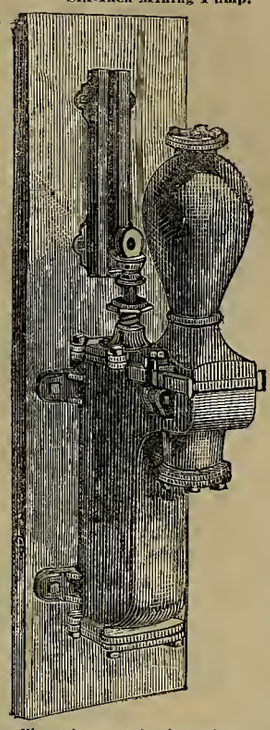
Millions of tons of tailings, now worthless waste, might thus be worked profitahly, and thousands of good mines not capable of profitable working by amalgamation or chlorination, could be made to yield fair profits. Millions of dollars annually would thus be saved to the country. Gold mining throughout the country languishes for the want of such a radical improvement. The additional cost of extraction by zinc may he stated as about $8 to $12 per ton, or less than half of chlorination, while it does the work fully or nearly as effectually, certainly infinitely quicker. R. D'Heureuse.

Iron Work for the Pacific Railroad. The entire capacity of the Pacific Rolliog Mills is taxed to execute the orders for the Pacific Railroad. The two sets of rollers are in full operatiou maiuly on long and short screw bolts for car work. It is found that the mill can turn out a good quality of work at satisfactory prices. A large set of rollers for railway bars have arrived from Birmingham, England, weighing about 4,500 pounds each. The demand for heavy iron work is worthy of note. It appears that the new industry was not ahead of the times.



HANSBROW'S CHALLENGE

Deep-Well, Mining and Double-Cylinder Patent Pumps.



These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

Six-Inch Mining Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactored by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,

LOCKE & MONTAGUE,

112 and 114 Battery Street, San Francisco.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering 3—Mechanical Engineering 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a

MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the Imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first-class dealers in the United States and British Provinces.

Folding Seats for Crowded Vehicles.

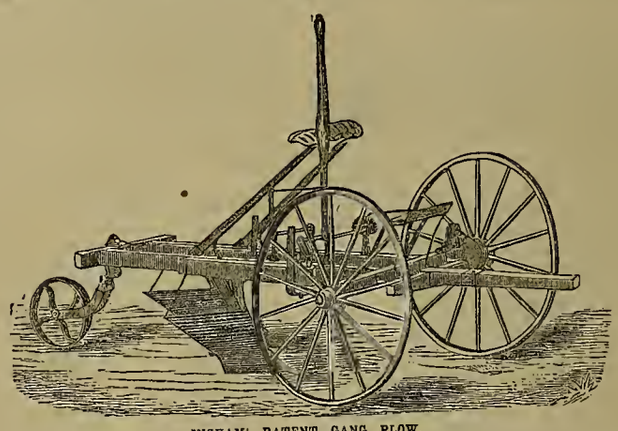
The accompanying illustration represents Charles H. Fosters' Folding Seat, for the accommodation of extra passengers, in crowded vehicles, for which he has applied for letters patent, through our agency. It is especially adapted to and ought to be generally applied in all city street cars, where its advantages are so obvious as to require but to be mentioned, in order to secure the warmest approval of everybody who is in the habit of using those public conveniences. The seats are first arranged and upholstered like those in ordinary use; then extra seats of brass or iron are attached to the outer edge by hinges. These additional or supplemental seats, when not in use, fold back bottom up upon the first or regular ones, in such a manner as to form a series of arms, dividing the space regularly, so that no one can occupy more than his or her proper share, as seen in the engraving. When the regular seats are all filled the extra seats can be turned down in

FOSTER'S FOLDING SEAT FOR VEHICLES.

a moment, and a car which under the old arrangement would seat only twenty-two persons, will seat thirty-eight—a space of twelve inches still being left in the center, through which people can pass in or out of the car.

Mr. Foster is a young mechanic of this city, whose inventive faculties were no doubt called into activity by the experience of standing up and seeing passengers jostling awkwardly into each others ribs, as the car unexpectedly starts or halts. As his invention affords the opportunity, at a very trifling expenditure, of doing away with all this, and besides of the necessity of giving up one's seat every time that a lady "heaves in sight," and of frequently becoming separated from one's companion in a car, it is to be hoped that the leading city railroad companies will be enterprising enough to bring it into immediate use, for the benefit of their patrons.

The shape of the folding seat is not material, but is so adapted as not to interfere with the regular seats while it is not in use, and folded back. In that position it is made to fit closely into the cushion of the regular seat, and the curve of its edges is such as to take it out of the way of the ordinary occupant. By this means it will be seen that the seating capacity of any car, or other place of whatever kind, where it is necessary to seat a number of persons, can be exactly doubled.



Death of a California Inventor.—Thomas Hansbrow, an old and highly esteemed citizen of this State, died at his residence in Sacramento on Monday evening, of paralysis, from which he had suffered for a long time. He was, in 1856, Superintendent of the City Water Works; in 1860 and 1861, a member of the Board of Supervisors for the Second District; member of the Legislature in 1855-6, and represented the State by appointment of the Governor, at the World's Fair, in London. Mr. Hansbrow was the Superintendent of the machinery department at the State Fair of 1867, etc. He was the inventor of "Hansbrow's Challenge Pump," "Hydrostatic Engine," "Amalgamating Pan," and other inventions suggested by the wants of the times, through which his name has become to the readers of the Mining and Scientific Press, as familiar as a household word.

Vaccination.—Dr. S. F. Elliott, late Health Officer of San Francisco, has written a pamphlet on re-vaccination, and how to prevent small-pox; giving the opinions of eminent physicians of Europe, and all desirable information on the subject that would interest those who may suspect themselves to have been exposed. Bancroft & Co., publishers.

Ingham's Gang Plow.

We herewith give the first newspaper illustration of Messrs. J. & J. Ingham's Gang Plow, a California invention of practical use and merit.

There are several improvements patented in this invention, including the application of geared wheels and segments for raising and lowering the plows, and regulating their hight by an adjusting screw; a toothed connection of the axle, so that, although the furrow wheel may at times be the lowest, the axle will continue horizontal; and a device for shifting the "polo" or draft connection, from one side to the other. A further statement of the advantages of this gang plow will shortly appear in our advertising columns.

INGHAM' PATENT GANG PLOW.

Messrs. Ingham are practical wheelwrights, and manufacturers of agricultural implements for home use, and are in constant communication with farmers whose wants they are thereby the better enabled to understand; and thus it is that they have succeeded, in combination with their native genius, in producing a plow which is decidedly popular where most used and best known.

We can also add that they are men of the right stamp, judging from our intercourse with them in the securing of their patent rights, and the voluntary testimony of mutual friends.

We advise those interested to make an examination of this plow on exhibition at the Fair, and address Messrs. J. and J. Ingham, of San José, for further information.

Close of the Fair.—The Fair proper will close on Saturday night, but during next week there will be a series of grand benefits for the Protestant Orphan Asylum, the Roman Catholic Orphan Asylum, the Ladies Protection and Relief Society, and several other benevolent institutions of this city. The goods on exhibition will not be removed till the end of next week. A grand ball on the 17th will constitute the winding up of the Fair of 1868.

A vile old bachelor says that Adam's wife was called Eve because, when she appeared, man's day of happiness was drawing to a close.

An Editor Complimented.—A very pleasant little performance came off at the office of the Mining and Scientific Press, on last week. W. B. Ewer, Esq., the senior editor, who was to leave on the next day's steamer on a visit to "the old folks at home" in the Eastern States, was made the recipient of an elegant and valuable watch, —the gift of the *attaches* of the office. All preparations having been made beforehand, at a preconcerted signal Mr. Ewer, who was engaged in conversation with one of the confederates, suddenly found himself enrounded by the whole body, the members of which had quietly arrayed themselves in a semi-circle,—the center being occupied by himself and Mr. J. L. Boone, who had been deputed to act as spokesman. Before he could guess at the meaning of this singular arrangement, Mr. Boone commenced;—and in a neat little speech, just long enough to give Mr. Ewer time to collect himself, announced the "object of the meeting." In fitting terms he expressed the regard and esteem of the donors; and having duly invested its new owner with the gift, concluded with a cordial good-bye on their behalf, and the kindest wishes for "a pleasant journey and a safe return."

Mr. Ewer responded with a few appropriate remarks,—evidently deeply gratified at this spontaneous expression of kind feeling; and the crowd dispersed, filing past him, and each giving him a hearty hand-shake as he said farewell.

Mr. Ewer, who has been in editorial harness since 1856 without intermission, takes a brief rest of a few months only; expecting to resume his duties in January next. He is accompanied by his family, and is followed East by the good wishes of a host of friends, besides those of whom we have spoken.

The watch, a most appropriate present to one whose efforts have been directed towards the advancement of American industrial enterprises, is from the American Watch Company's establishment, and is elegantly cased in gold. The inside of the outer case bears the following inscription: "To W. B Ewer, M.A., from M. & S. Press associates."

Removal.—Our friends will please bear in mind that the Mining and Scientific Press Office, Patent Agency and Job Printing Office has been removed from 505 to 414 Clay street, about half a block below Sansome.

Our Industrial Fair.

[From the Mechanics' Fair Daily Press.]

General Review of the Exhibition.

CLASS XX.

Oil, Soap, Candles and Paints.

Olive oil of a superior quality, manufactured from olives grown in the southorn part of the State, by C. Louis, may be seen on the right hand side, not far from the entrance. It has the perfect light olive color, and the air bubbles inside when made to travel through it, do not betray thickness or viscidity.

Salad oil is exhibited hy Lake & Co. It is also of California manufacture, and differs hut slightly from the olive oil in appearance.

Dana & Codington exhibit a tall sample bottlefull of strained neats foot oil, of their own manufacture, besides glue and curled hair.

The Pacific Linseed Oil Works exhibit a variety of valuahle productions: raw linseed oil, of a light yellow color; hoiled ditto, of a dark walnut color; castor oil for medicinal, and also for lubricating purposea; linseed cake in slahs, and the same ground to powder for cow feed; metallic paint for ships' bottoms, tin roofing, outdoors of buildings, and machines; California and Oregon flaxseed, and castor beans.

Blacking is shown hy Lake & Co. known as the Japanese paste and by J. Herkimer, a water-proof blacking intended for harness, as well as hoots.

Soap is exhibited by the Eureka Soap Factory, entitled the Eureka Soap, and an article called the Erasive Soap Powder, in boxes, of which there is quite a stack on hand.

The Standard Soap Company makes a very large and enterprising exhibition, which is attractive to sight-seers as well as closer observers, comprising the materials from which soap is made: tallow, resin, sulphate of soda, cocoanut oil, and caustic soda—and also a number of incidental products, as sulphate of lime, oleic acid, stearic acid, glycerine, and residuum. The varieties of soap made by the Standard Company are: the chemical olive soap, glycerine, detersine, porcine, primrose, honey, etc. Wax candles, or aomething resemhling them very closely, and hydraulic pressed adamant candles, hesides washing powders, are also manufactured and shown hy this company.

Washing compounds of two kinds are represented: Bowman's, an oily substance with floating curds, resemhling cocoanut hair oil; and Kelly's, an olive colored, clear oily fluid.

Judson & Co. likewise exhibit hydraulic pressed adamautine candles with oleic acid.

The San Francisco Candle Company, whose factory is at the Mission, make an interesting exhihition of materials and products: oommon tallow; saponified or decomposed tallow, of a dark color; decomposed fat, purified and crystallized, preparatory to being pressed; stearic acid in cakes from the hydraulic press; and candles as they are sent into the market.

Paints and colors are represented in the productions of O. A. Olmstead's paint mine at Olmstead's Mills, Sonoma County. There are twelve different shades of color ahown—dry in hoxes, and also mixed in tin cans. Chemically they appear to he chiefly only different proportions of an earthy mixture of the sesquioxide of iron, hut as these are all of a different color, the manufacturer has been ahle to present very tolerahle pigments of sienna, ocher, umher, blue, hrown, red and hlack. The discoverer of this paint mine was a lady, Mrs. Mary Olmstead, aged 60, from whose hand there is shown a painting of ornamental work on glass, done with he natural products of her discovery.

CLASS XXI.

Painting, Drawing and Photography.

Nahl, Butler, Burgess, Marple, Bush, Arriola and Narjot, are the authors of some of the best paintings found in the Art Gallery. Kipps, Holdredge, Goddard, Wise, Woods, Young, Lai Yong, Frey, Henry, and others, exhibit works of less prctension and merit.

Nahl's mule train crossing the Sierra Nevada in a anowstorm, reminds one vividly of the real scene,—transports one to the spot, and carries with it all the sentiment of the situation. His Joaquin escaping, is a study alike for the historian and the romancer. Both pictures indicate the posaesaion of the tact to seize upon characteristic and salient phases of real life, the perpetuation of which are sufficient to immortalize any pencil or pen so employed. His picture of antelopes surprised hy a panther, exhibits a different style of handling as regarda natural history.

Butler exhibits nine pictures, all of them evincing the artist's power. The central portrait of a gentleman, numhered "238," and the simple-hearted, honest-eyed little lady to his left hand, (can she be a Californian?) will he acknowledged by every one to possess a degree of character and soul which is very seldom caught in a photograph. His dog—the ratty little fellow looking out of his cage on the right hand, and the generous New Foundland above, apparently scanning some friend at a distance—are instinct with life, and illustrate the traits of dog character, which lie at the foundation of the ancient friendship which sprung up, and which has existed between the talking and the harking animals, probahly from the time when they were first let loose together upon created earth. A liking for the portrayal of animal characteristics, shows itself also in the picture of a youthful horse, whose lineage, though undouhtedly most worthy, does not trouhle him,—any more than that of the passing Californian does him. Sandy and his dog in the Western Highlands, overlooking a frith, impress the spectator with just such thoughts as the traveler to the land o'cakes would be likely to bring back with him in some corner of his memory. The remaiuing portraits of Butler, though spirited, have some peculiarity in their finish which detracts from the otherwise favorable im-

Bush's "Chagres River" portrays successfully the wonderful riches of tropical forest and water. In his "Panama," aud some other pictures, he did not stop loug enough to sketch what he saw,—possibly from fear of catching a whisk of fever,—to enable him to get in all the beauties that he might have elaborated.

Arriola's "Isthmus of Tehauntepec" by moonlight, shows almost an opposite aspect of tropical acenery, as well as a different style of treatment, hut it tells the truth very successfully. As to his vivid coloring of day scenes, nature colors hrilliantly in California, and paints are cheap; hut people do not see all the colors as hrilliantly as they sometimes are, and it is safer for the artist to paint modestly that which manifests itself to us in so delicate a manner.

Narjot's "Mexican Conducta" is a valuable contribution, because it is a well painted picture of real life and character.

But it will be impossible to make reference to everything that is praiseworthy in the Art Gallery. There are ten hrilliaut water colors by Goddard; eight oil paintings illustrating an honest miner's carcer, by H. J. Frey; five pencil and India ink drawings from Shubrickville, by Gustavus Janssen; au amusingly literal family group, hy a Chinaman; a numher of old masters, —Remhraudt, Rubens, (?) and Rosseau; numerous frames of moss and wax pictures; an English racing scene; an architectural piece, hy Kenitzer & Farquharson; frescoes and a crayon Apollo, by Otto Schrader; decorative work, hy Hirst & Nisby, etc. There is a large nnmber of pencil drawings in the Music Room, executed by the pupils of the Denman Grammar School, and of Oakland College School.

Photographs are exhibited by N. M. Klain, Thomas Houseworth, Bayley & Cramer, Bradley & Rulofson, C. E. Watkins, Silas Selleck, and Mr. Vaughan. Specially deserving of mention and commendation, are Houseworth's stereoscopic and wall views illustrative of California life and scenery; Bradley & Rulofson's scenic combinations with ordinary portraiture; and Watkin's landscapes, frequently betraying the judgment of a real artist in the selection of atandpoints.

Embroidery of wonderful execution, illustrating the feminine addiction to patient routine, (as legitimate means, perhaps, of keeping out of mischief), is exhibited by Miss Juliana Boyer, Mrs. Louis Zeh, Madame Champion, etc.

CLASS XXII.

Musical Instruments.

The piano factory of Jacob Zech, of Ninth street, is represented by four instruments, two upright and two square pianos. One of the uprights is made of heautiful variegated laurel, polished hy Dennis Doolan. Prices, $500 and $600.

Bowers' music depot furnishes three family (Smith's) melodeons, of different sizes, a church organ with treadle bellows, having sixteen stops, and several Hazeltine pianos for $500 and $600.

A miniature piano is exhibited which was made by Michael A. Lawton, a boy who never worked at any trade.

In the front gallery, C. Wiederhold & Co. show two uprights, a grand and a square piano; the grand piano for $1,200 and the square for $600.

Rosenherg exhibits Knabe's pianos; a grand for $1,000, and a square piauo for $600. Also, a Burdette organ with four stops, for $250, and a case full of brass and wind instruments.

John G. Davies exhibits superior flutes of his own manufacture, iu the art gallery.

C. C. Keene has a case containing drums, accordeons, guitars, banjos, hrass instruments and a hassoon.

The calliope completes the list.

CLASS XXIII.

1—Woolen Manufactures.

The display of articles of the hetter quality of woolen manufacture, along the south side of the Pavilion, constitutes the most marked feature of the exhihition, as evidencing the advancement of economical manufacturing on the coast.

The Pioneer Mill was the first woolen mill established. Every few months new styles of goods are brought out, adapted for use on this coast. The mill was established in 1859, and was started with 8 looms and 1,000 spindles. It has been enlarged until it now has a frontage of ahout 400 feet by 60 feet in depth, and operates 7,000 spindles and 72 looms of the latest improvements. Upwards of $20,000 per annum are paid for dye-stuffs; the hands number from 375 to 400, and from $20,000 to $25,000 a month are paid to operators.

There are hlankets of every style; flannels that would not irritate an infant; cloths which are sought for opera cloaks, of every variety of shade and texture; heavy goods for overcoats, and lighter ones for the nice young man, and shawls of sober colors.

The Mission Woolen Mills occupy a large space with a great variety of goods. The knit goods have become famous for strength, good texture and wear. Every conceivable variety of them are shown, hesides a line of blankets which would make the eyes of the young housekeeper glisten. Heavy overgoods, cassimere and beaver cloths are shown good enough to clothe royalty itself.

A workman from the Pacific Woolen Mills produces a clatter with a knitting loom—an English inveution lately received here, for knitting drawers and undershirts.

A woolen factory was started about six months ago hy a joint stock company, comprising many of the promineut citizens at Marysville—not so much as a speculation as to infuse new life into their town. The experiment has been succcssful. They are now running night and day, and their products are engaged ahead. These mills claim advantages over those in San Francisco, inasmuch as they have invested but a small amount of capital in real estate, and can purchase wool in the neighborhood, thereby saving the freights which have to be paid by the San Francisco mills. At present their flannels are in particular demand, for which reason they do not manufacture so large a variety as they will when their capacity is increased. The mills are now turning out from $6,000 to $10,000 worth of goods per month, and machinery now on the way will enable them to manufacture double this amount and produce a greater variety. They have on exhihition gray and white blankets and a variety of flannels. The capital of the company is $50,000, only $8,000 of which was absorbed in real estate, leaving the balance for the legitimate purposes of the factory. Owing to their facilities for purchasing the raw material, they claim to he ahle to undersell the San Francisco mills, a proposition which it will take time to determine. L. & M. Sachs & Co., of this city, are agents for the mills, and have entered iuto a contract for the entire product, excepting only such as are taken by a wholesale house in Marysville, for the local trade.

2—Cotton Manufactures.

The Oakland Cotton Factory is the only establishment of the kind on the Pacific Coast. It was erected four years ago, and has been at least a partial success. As yet, the yield of cotton in California is not sufficient to keep it in constant supply. The proprietors are compelled to import largely of their raw material from the Atlantic States, Mexico and Oregon. They run thirty-two looms, work about forty hands, and consume 150,000 pounds of cotton per annum. From this amount of stock they turn out 300,000 yards of cloths, sheetings, shirtings and drillings, in the same length of time.

The goods exhibited at the Fair, comprise linseya for ladies' dressea of several distinct and substantially manufactured styles, different in quality and colors; also thirty-five different patterns of tweeds for gents' and boys' wear; water-proof tweeds for overcoats; unbleached shirtings and sheetings of all grades of fineness. The drills are considered the hest in the California market. William H. Rector, the senior proprietor, is expected to return from Europe on the incoming steamer, having been absent for the express purpose of procuring machinery for the manufacture of flax, jute, hemp and other coarse fiber into grain bags. After it has gotten fairly into operation, the farmers of Alameda, San Joaquin, Contra Costa, and other grain-growing counties, will be enahled to secure their sacks cheaply, almost at their doors.

CLASS XXIV.

Furs, Clothing, Hats and Caps.

Adolph Muller has a great variety of goods, of his own manufacture. There are capes of Siberian mink at a cost of $600, of Siberian sable, valued at $2,500, with $200 additional for a muff; huggy robes of hadgers, lynx, wildcat and tame cat, fox, bear; Astracan and sea otter capes, ermine, etc. The manufactory employs abont 25 hands, including four cntter and several fur dressers. Mr. Muller imports all his skins raw, and makes them up to order. The larger part come from the northwest coast, hut some are brought from Europe and Africa.

H. Liebes & Co., fur dealers, exhibit a large variety of goods of their own manufacture. In this collection is a rug made of 5,000 pieces, and representing all the skins of fur-hearing animals known in the world. There are silver fox skins, ermiues, sables and minks, the whole constitnting a tasteful assortment.

The fur husiness has greatly increased of late aud the samples on exhihition illustrate the hest stylea of these goods is now made up in the city.

Clothing is exhibited hy a number of firms: S. Reinstein, of the Pioneer Clothing Factory; by the Pioneer Woolen Factory and the Mission Woolen Mills; the Pacific Woolen Mills, (knitting work), together with a knitting loom, which is at work occasionally; hy J. & S. Figel; Meyer Jonasson & Co., (ladies' clothing); H. Friedlander & Co., ladies and childrens' under garments; by H. M. Heimann, of the Pacific Necktie Factory; Lancaster's "perfect fitting pants; and by Josephi Bros., general clothiers. Specimens of blanket cleaniug are shown by Weyer & Co., and of kid glove cleauing, by John F. Snow.

Hats and caps are exhibited of the hest quality hy Meussdorffer, Lamott and Adams.

CLASS XXV.

Silk and its Manufacture.

Mr. L. Prevost, of San José, who is the pioneer iu the silk business in California, has charge of that department in the Exhibition, and lends his aid to Mr. Newman, the first manufacturer who practically demonstrates the various processes through which the cocoons are put from the time the worm leaves them until they are presented to the public in the shape of manufactured articles. There are several bushels of cocoons on exhibitiou, but in order to prevent people from handling them they are kept iu a large-sized glass case. The cocoons consist of the sheath of loose filaments, attached to the twigs that support the whole, and heneath this the external coat of soft flossy silk, within which is the compact, oval hall or cocoon proper. The thread is not wound regularly around the inside of the hollow ball, but is passed back and forth in one place after another in such a manner that many yards may be wound off without turning over the ball. It is produced through two orifices in the nose of the worm, and the two fibers, on issuing forth, are secured together by the glutinous matter which accompanies them. The cocoons are placed in a trough holding hot water, which is kept at the necessary temperature hy a steam pipe. The gummy matters are softened hy the water, and the fihers are thua released. The ends are caught up hy a little aort of hroom, with which the coooons are stirred, and heing hrought together, are passed through an eyelet, which atrips off a portion of the gum, and still more ia ruhhed off hy causing the threads formed by each hundle of fihers to cross and ruh against each other as they are conducted in a diagonal mauner through a succession of eyelets toward the reel, just previous to reaching which all are united in one thread, which is woven into a delicate fahric on the spot, hy a skillful workman, on oue of Mr. Newman's looms. California possesses many advantages as a silk-growiug country, chief amougst which may he mentioned the fact that the worms do not become diseased.

The European manufacturers obtain the greater part of their raw matcrial from China and Japan. Before the establishment of a line of steamers between this State and China and Japau, the Eastern manufacturers obtained their raw materials from London, but they now receive all their supplies through San Francisco. The spinning department can he worked auccessfully with

children, from thirteen years of age and upwards.

Men who have lands suited to the production of the mulberry tree, and others who have means to undertake any new thing that offers to be remunerative, are inquiring into this business, and not a few are already preparing for it.

CLASS XXVI.

Sewing Machines, Needlework, Millinery, etc.

All the competing elements seeking for the ascendency in practically applying this most beautiful of all the mechanical triumphs of modern times, are of course represented in a place like the Mechanics' Institute Fair, whose area of contribution is the Pacific Coast; and not merely represented, but the blessings of the sewing machine are silently and most eloquently advocated to the passing multitude by very amiable representatives of the gentler sex for whose elevation that invention was undoubtedly intended. The masculine engineers and advocates of the ingenious machine—successors to the philanthropic spirit of Elias Howe, who seem to be out of place if they do not evince a consciousness of that fact in their very demeanor—are also there to support their special cause with abundant energy; and the thinking mechanic himself, who is the creator of such wonders, might sometimes be observed leaning over the railings to take a passing glance at the execution of the several little parts whose function he well knows that he understands far better than do the delicate hands that have them under such complete control.

It will be impossible to speak fully of all the sewing machines, and it is moreover quite unnecessary, as the machines are themselves exhibited and will speak plainly and unabstrusely to the visitor and observer. We will merely mention what machines are to be seen, and by whom they are exhibited.

There is the Florence, exhibited by Samuel Hill; the Grover & Baker, by R. G. Brown; the Wheeler & Wilson, by M. M. Stoddard; the Singer, by Davenport; the Wilcox & Gibbs, No. 203 Kearny street; three sewing and one knitting machine, by A. H. Supplee, viz: the Sloat machine, the Elliptic Hook machine, the American Combination Button-hole and Overseaming sewing machine, and the Bickford Family Knitting machine; the Hancock Hand Sewing machine, by Fuller & Co.; and a Ladd & Webster machine with some newly invented applications, by Mr. Hanna.

The Florence sewing machine was more specially examined by us. Its peculiarity to the spectator, is the lever motion of the beam which carries the needle, being oscilated by means of a sliding eccentric at the opposite end. It makes four different stitches, the lock, knot, double lock, and double knot, on one and the same machine, each stitch being alike on both sides of the fabric. Every machine has the reversible feed motion, which enables the operator, by simply turning a thumb-screw, to have the work run either to the right or left, to stay any part of the seam, or fasten the ends of seams, without turning the fabric, changing the length of stitch, and from one kind of stitch to another, can readily be done while the machine is in motion.

The wide range of application and facility of control which it affords, have won for the Florence a reputation as a family machine, and for such uses it was decided in 1866 by the committee on sewing machines of the State Fair to be the best thing thus far invented.

The Grover & Baker machine holds a prominent ground against other competitors for public favor. It is an old campaigner, and yet is up to the times, in having taken advantage of every available improvement. One great advantage claimed for their family machine is the elasticity and stretch of the stitch, which is effected by means of two spools of thread, one above and one below the sewing. No better evidence of the correctness of this claim could be offered than the fact which is mentioned to inquirers, that the Grover & Baker machines are used and driven by steam at the Pacific Woolen Mills for the manufacture of elastic underclothing, where a rigid stitch would tear on stretching. By steam they make 1,600 stitches a minute, while by hand from 200 to 300 is the extreme of the rapidity that can be attained.

Their large and heavy lock stitch machine for boots, shoes, carriage trimmings and heavy clothing, is the newest and most approved machine of the kind in the market, and is generally used in the boot manufacturing establishments of San Francisco. In rapid action it is claimed to be run with a steadiness never before attained. By new and simple devices the difficulties arising from unevenness of tension upon both shuttle and needle thread, are overcome.

No prize is competed for by the exhibitors of sewing machines, it being deemed better policy to encourage a full exhibition of all the different machines to be found in the market, in order to enable visitors to judge for themselves as to their merits.

In millinery there is a great deal to be seen, for ladies. But what is it that makes them so passionately fond of filigree work, or any kind of work that requires only a great deal of devoted patience? Is it not a waste of their best life and exertion and of the principal value of such goods, when the significance of the article manufactured by women is overlooked, and it is allowed to change hands for a mere price in money? The devotion that must manifest itself, with or without any object, as the child by instinct must have its doll, is "cast upon the waters," without returning for many days.

We can barely mention the establishments represented: H. Friedlander, millinery and ladies' clothing; Mrs. E. E. Caswell, Golden City Straw Works, French buckram frames; Jacobs, Newman & Co., hoop skirts and trimmings; Mrs. Van Deusen, millinery; Madame Goldberg, fashionable trimming; Mrs. Gabriel, embroidery with fish scales; Ladies' Depository—Mrs. Kirwan, fancy articles for children; Mrs. E. Blochman, bonnets, etc.; another Ladies' Depository—J. W. Davidson, children's embroidered articles; Women's Co-Operative Union, ladies', gentlemen's and children's furnishing goods; Mrs. M. A. Butler, millinery; Mrs. M. Curtis, garment-cutting and embroidery.

The Pacific Straw Works make an interesting exhibition, chiefly of ladies' straw hats, of very elegant appearance. An iron heating and pressing machine, to shape the articles after being manufactured, is occasionally at work.

Mrs. Bolander exhibits fine hair jewelry and embroidery. Mrs. C. Cook has a large and splendid exhibition of tastefully executed hair jewelry.

Samson Rosenblatt exhibits cloaks and lace materials.

John D. Barr and J. Alsop have cases of ladies' parasols, of good quality and appearance.

CLASS XXVII.

California Wines and Brandies, Bitters, Punches, etc.

Samples are exhibited of every brand manufactured by all the leading wine producers of the State. The display is uniformly unostentatious, but completely representative. B. D. Wilson occupies a well used space with the Lake Vineyard wines, and J. R. Snyder is alongside with all the known varieties of Sonoma wines. Perkins, Steru & Co. and Kohler & Frohliug make equally complete exhibitions; the comparative qualities of all of which are better discussed lahially than descriptively. Eberhardt & Lachman, besidee ehowing various brands of wines, make eomewhat of a epecialty of California hrandies. Sparkling wines by J. J. Landsherger, and Los Angeles wines by M. Keller, complete the list of native wine producers represented, who do not at the eame time make a specialty of other liquors.

McMillan & Kester exhibit syrups, cordials, essences, bitters, and California wines. J. Sajous exhibits some wild grape bitters, and Bennett'e Ale and Porter. Wertheimher & Waterman exhibit hitters, cordials, and wines; Dr. Henley's Wild Grape Root Bittere and other bitters, are represented in a large array of hottles and packages; Whiting & Berry make a fine exhibition of unadulterated wines and hrandies for medicinal purposes, besides punches and bitters and showy pyramids containing samples of punches are erected to represent Ricci & Bona, the successor of Squarza, in their particular specialty.

CLASS XXVIII.

Agriculture, Horticulture, Seeds and Plants.

Though the Institute Fair was not intended to embrace an agricultural exhibition, yet it is perfectly within the scope of our mechanical interests to represent prominently every kind of tool or machine that is manufactured for the use of farmers. More regard was paid to this department at the last exhibition than there is at the present. All the articles on exhibitiou have already heen noticed under Class II, with the exception of such as have been since added.

Booth's combined Shaker and Grain Separator is exhibited. It is arranged in a box, on three legs, and vibrates by hand; weighs only 25 pounds, can he operated anywhere, and separates and cleans from 10 to 20 bushels per hour. It is said to be perfectly adapted to the work of eeparating oats, barley and all small seeds from wheat.

Two of Randall's Sulky Rakes are shown hy Smith & Weister, of San Francisco, one with iron, the other with woodon teeth. They are drawn by horses, and the driver loads or discharges the rake at the proper points by means of a lever, acted upon by his feet, which lifts the rake.

Slusser'e self-loading excavator doserves notice as an ingenious and valuable labor-saving contrivance. It consists of a load-box, endless elevator and steel shovel plow-shaped scoop, carried between four wheels like a wagon bed. The ecoop is situated under the forward axle; behind it is the elevator, and hetween the hind wheels is the box to receive the dirt. The driver sits over the forward axle, and the operations performed hy him consist simply in placing his foot on a treadle, and by a slight pressure when he comes to the loading ground, drops the scoop to any desirable depth, and the forward motion of the machine causes the earth to slide over the scoop on the elevator, up into the hody. The driver then proceeds to the dumping place, and without stopping, eimply pulls the trip-rod, which instantly drops the whole load through the hottom. The machine has heen tested, and ie said to work well.

A ditching machine is exhibited by Mr. Warren, of the *Farmer*, in the front gallery, which looks like a combination of the plow, and the "cow-catcher," besides numerous other articles from the *Farmer* office, which are very attractively displayed in the gallery, embracing agricultural curiosities and specimens of natural history. There is a novel American gate which opens up into the sky, and there are cashmere and cotswold fleeces of extraordinary richness.

Lamb's Vegetable Cutter is a new kind of machine, on the principle of a coffee mill, for cutting up potatoes, turnips, etc.

Mr. Perkins, the proprietor of the Golden Gate Nursery, (on the other side of the bay), has in the Fair 130 varieties of seeds. Forty-six of these are of this year's growth, freshly gathered, At the Paris Exposition Mr. Perkins' seeds attracted the attention of the Emperor, and were presented to him by the exhibitor, and planted in the gardens of the Tuileries, where they prospered so well that the King of Prussia has also desired samples.

Miniature gardens containing many rare and very beautiful plants, are planted near the fountain hy Mr. Woodward, from Woodward's Gardens, and by Collie & Stewart, of the Lone Mountain Nursery, which invariably attract the attention of the ladies, while the sterner sex are apt to pass them by. Mr. Woodward exhibits a great variety of foreign plants, embracing much that is beautiful and curious in Nature found in Central and South America. He has pine-apples, oranges, hananas, lemons, egg-plants and other tropical fruits growing—some ripe, while others are only partially ripe.

Collie & Stewart, of the Lone Mountain Nursery, have a superior collection of native California plants. They have devoted a great deal of time and attention to collecting native plants from all parts of California, Oregon, Arizoua and Nevada.

J. O'Hara, of tho nursery and flower garden on Napa and Twentieth streets, makes an elegant display of cut flowers and evergreen plants. His cut flowers embrace dahlias, fuschias, verbenas, roses, pinks, and a numher of very heautiful flowers with rare and unpronounceahle names. His collection of roses embraces a number of varieties, some of them very rare and all very heautiful. To him is due the credit of the evergreen ornamentation of the Pavilion in the neighhorhood of the fountain. Amongst the evergreens exhihited hy Mr. O'Hara, we may mention the English holly, the juniper, the Italian cypress, pines, specimens of the Mariposa Big Tree varieties, the India-rubber tree, the wax plant, etc.

J. Hutchinson, of Oakland, makes a very pretty exhibition of dahlias.

William Cantelan displays some magnificent-looking grapes, of the Napoleon variety, grown in his vineyard in Vaca Valley.

Dr. H. Haile, of Oakland, exhihits specimens of lemons grown in his garden. He shows the blossoms, the green fruit, and the matured fruit, all plucked from the same tree.

A very attractive display is made of apples grown in the Kerchiville Orchard, on the hanks of the Sacramento River. Some of the apples weigh nearly three ponuds, and look decidedly toothsome.

Mr. R. Muller exhibits Muscat, Rose, Muscat of Alexandria, Rose of Peru, and other varieties of grapes, all very fine, and calculated to make the months of those who look at them water.

J. V. Sims, whose orchard is on the Sacramento River, makes a very fine display of peaches, of different varieties.

A variety of excellent pears and magnificent Columhia plums, grown upon the hanks of the Sacramento River, are shown by the proprietor of Holland'e orchard.

E. J. Cummings exhihits two jars of fruit—one of pears and the other of nectarines—preserved in liquor. These jars were prepared ten years ago, and look as fresh and sound as if they had just been put up.

CLASS XXIX.

Substances used for Food.

The maccaroni and vermicelli establishmont of Raveuna, Ghirardelli & Co., is finely represented. In the ample showcases, divided and enbdivided into appropriate compartments to give them favorahle exhihition, are found such designations as trenette, lasagnette, Bianchi fini, mostacioli Bianchi, mostacioli daperian, lasagnette fini, and some twenty other kinds with equally unpronounccahle names to the unpracticed Anglo-Saxon ear.

Brignardello, Machiavelli & Co. make a eimilar exhihition of the Italian pastes, which are sometimes molded into shapes resembling succulent vegetables.

J. Knoll exhibits Clayton'e salad dressing,—the concentrated and hottled skill of a generation of bachelors, a yellowish oily looking fluid,—and some French mustard.

The Pioneer Flour Mills are represented by twenty-one specimens of variously ground peas, barley, wheat, corn, oats, buckwheat and rice.

Lake & Co. exhibit salad oil, and C. Louis, of Los Angeles, exhihits pure olive oil; hoth hoing of native production.

The Boston Cracker Bakery, at the corner of Broadway and Battery streets, is represented by a very handsome exhihition of all the varieties of crackers in the market. In another part of the Pavilion, J. H. Clark exhibits also varieties of Boston, and other crackers.

Salt is exhihited by B. F. Barton, of the Pioneer Salt Works, and by Holliday & Brenhem, of the Uniou Pacific Salt Compauy.

Vinegar is shown in barrels by Henry Schammel.

Under this head mention may be made also of the excellently kept Exhibition Restaurant of Mr. Mathiessen, iu oue of the wings, and of the cake and ice cream counter of McMillan & Kester in the front gallery.

Coffee and spices are shown hy C. Bernard—green and roasted, and Chartres coffee, ground spices, mustard, giuger, etc.; by B. Ackerman in the form of extract of coffee in packages and cans; and hy Marden & Myrick, whose display has the appearance of a miniature shop.

The California Chicory Manufactnring Company exhihit several kinds of chicory, ground into different degrees of fineness. The annual consumption of chicory, or "health coffee," as it is called, amounts in this State to 300,000 pounds. The company'e orop amounted iu 1867, to 100,000 pounds.

Samples of sugar are exhibited by the California Sugar Refinery. The show-cases contain slabs of sugar with inscriptions, and the different varieties and processes of manufacture are ehown, from the crude hrown article to a perfect state of crystallization and refiuement. Their clarified eyrups are also worthy of notice, of which there are sixteen samplee displayed.

The San Francisco Sugar Refinery, another estahlishment, exhibit an attractive assortmont of sugars, in loaves and lumps, in a finely pulverized condition.

CLASS XXX.

Miscellaneous—Tobacco, Telegraphy, Perfumery, Artificial Hair, Gas, etc.

Julius Morris exhihits a fine assortment of California cigars. Mr. Morris has heen in the husiness, in this city, for eight years, and employs 100 men, turning out 200,000 cigare per month. The large "after dinner cigar" is the work of Mr. Morris' own hands, and is six feet long, twenty-four inches in circumference, and contaius forty pounds of tobacco.

R. G. Gelien exhihits eome very excellent imitation Swiss cigars made at hie factory by the fair hands of women.

Joseph Gross exhibits cigars of excellent finish. The exterior is smooth and uuiform, and they are neatly packed and displayed.

George J. Hobe exhibits a fine assortment of emoking and chewing tohacco of all the popular brauds, and several varieties of San Francisco made snuffs.

Parker, Watson & Co. make a fine display of emokiug and manufactured tobacco. The smoking tohacco is of California manufacturo, being made of the Virginia leaf, which is imported in its crude etate, in hogsheads. As yet but little good tobacco has been raised in California, the weed growiug rapidly and rank, which makes the leaf thick and gummy.

B. C. Horn & Co., one of the oldest and best tobacco houses on the coast, make a modest display of their particular brands,

which are too well known to require comment.

Charles G. Emery & Co. exhibit their Green Seal smoking tobacco as a specialty.

Charles Kohlmann, meerschaum pipe manufacturer, exhibits raw meerschaum and amber, and a fine case full of pipes and amber mouth-pieces.

The State Telegraph Company exhibit an ordinary telegraphic instrument to the right hand of the fountain, where people can get "shocked" gratuitously. Similar working instruments are exhibited by the Pacific Business College, and by the California Business University.

Curled hair and glue are shown from the Pacific Glue Factory, of Dana & Codington. Kunitz's Santa Cruz glue is adjacent.

C. M. Chapin shows a fine case of perfumers' and barbers' and friseurs' goods.

Mrs. E. Doherty has a luxuriant supply of artificial hair and toupés for ladies.

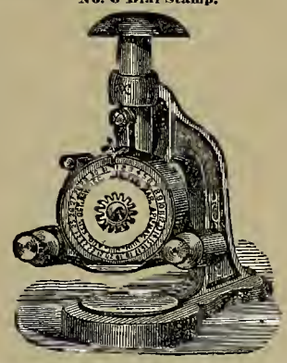
H. Olsen shows a combination life-preserver and swimming apparatus. The hands and feet are enlarged and webbed like a frog's, and a bag of air is fastened on the back of the swimmer.

In addition to these there remain to he mentioned: Specimens of galvanism, by G. Kustel; a model of a flying machine, in a dilapidated state, and not exhibited, by Fearing; a self-generating gas machine, by Robert Heuston; soda fountains, by Willis and others; several very interesting cabinets of stuffed birds and other specimens of natural history, by Lorquin; a gymnastic swing, by S. E. Bradshaw; the fountain fleet, by Swyney & Smith; some revolutionary paper money, by Mr. Butler; a weather vane, by James Ross; a lamp extinguisher, by F. Rohrer; a castle made of playing cards, by L. P. McCarty; a picture of the San Francisco recreation grounds, by Hatton & Kohler; walrus tusks, sea shells, wax flowers, etc.

A few new entries are still made each day. Amongst these are a Harrison boiler, by Tay, Brooks & Backus; an iron planing machine, by the Pacific Iron Works; a miniature war steamer, from Woodward's Gardens; and a fine oil painting, entitled "Affections last Offering," by Toby E. Rosenthal, a young San Franciscian who has been studying art for several years past with promising success, at Munich.

Carvalho's Superheater.—This valuabls and important invention for the economization of fuel, has been satisfactorily tested in the large boiler which is supplying the steam for the engines at the Pavilion. Nothing could be more simple, or more natural than the increassd power from the same quantity of fuel, or from the same amount of steam when superheated. As the moist steam leaves the boiler in pipes leading to the engine and is exposed to the cold air, much of it is condensed to water and rendered ineffective. The superheater is merely a double winding of pipe filled with coils of iron wire to absorb the heat and impart it to the steam, which conducts this same steam hack again through the fire, heating it to 500°, before transmitting it, and making it perfectly dry. The gain in effectiveness is estimated at 25 to 35 per cent. The principal difficulty of the engineer at the Fair, since it is applied, has been to keep the fires low enough to avoid getting on too much pressure.

The advantages of this invention are evident when it is remembered that most of the steam generated in boilers passes through a greater or less depth of water before reaching the surface, and so becomes unavoidably charged with moisture, while the water which is thus carried over hy the steam has been highly heated at the expense of the fuel, is of no benefit for power, and of little avail for heatiug or drying purposes. The amount of water mechanically mixed with ordinary steam is further increased by the condensation which is constantly taking place in cylinders and steam pipes, while if the boiler "primes," as is quite common, the evil referred to is aggravated. The volume and elasticity of this wet steam are necessarily very greatly increased by drying it before use; and though this principle has long been known, advantage has never beeu taken of it practically on account of the expense aud want of durability of the apparatus used, a difficulty which has now been successfully overcome. Being no longer a matter of experiment, the application of the superheater to all ordinary steam boilers is a mere question of economy, which can be very speedily determined by thoso who are interested.



These superheaters are manufactured at the Ætna Iron Works, for Robert S. Harris, agent for the Pacific Coast. We learn from Mr. John L. Constable, who is the engineer, that they are being adopted into use in various sections of the country.

Paper and Stationery.

One of the most unmistakable evidences of the progress of civilization and refinement in any community, is the multiplication of hooks, paper and stationery. The hookstore and the stationery warehouse are the local habitations of literature, and their benign influence goes out among all the people who visit them. These two classes of business were formerly always connected; in fact, a "stationer" was a bookseller, so called, not because he sold books, but because he occupied a *stand*, or *station*, for their sale. As the extent of this business increased, hy reason of the more universal interest taken in literature by the masses, the two departments were separated, and a stationer came to he considered as one who deals chiefly in paper, hlank hooks, writing materials, etc.

Few persons are aware of the importance and extent of this branch of business on the Pacific Coast, or of the large amount of capital and labor employed in the home manufacture of paper, hlank hooks, etc. It is already becoming an important branch of our industrial pursuits. Messrs. John G. Hodge & Co., at the corner of Sansoms and Sacramento streets, have long been engaged in this branch of husiness—some ten years — have the largest stationery estahlishments on the coast, and are fully prepared to meet the wants of the country at large. As people in California require the hest of everything, they pay particular attention to obtaining such goods as are manufactured by the Carew Company,—extra fine writing and ledger paper, and J. G. Shaw & Co's make of hlank books,— both of which have a world-wide reputation, as heing superior to all others.

No. 6 Dial Stamp.

These goods, with everything helonging to the stationery and paper business, can he snpplied in quantities to snit, and at low prices.

Messrs. Hodge & Co. are also agent for Hills' patent dial, cancelling and bank note stamps, the only stamp in use having a dial to indicate the dates. These stamps are of various patterns, for railroads, hanks, for envelopes, seals, etc. One of the numerous neat styles is herewith illustrated, hut their superiority shows most clearly hy personal examination and long usage.

This Honse is manufacturer's agent for these stamps, and make a specialty of that branch of this trade, keeping a good variety on hand to suit the wants of the trade in regard to style, size and price.

Last winter we visited Mr. Hill's workshop in Springfield, Mass., and saw the various parts of the stamps, made hy machinery, to economize their cost and make perfect and exact parts. We can say they are thoroughly made for durability and use. Mr. Hill is not only successful in making good stamps, but we should judge from appearances, is leading the trade in his lioe.

They are also agents for Hill's superior branding iron, for branding tool-handles, etc. This instrument is very convenient, desirahle and cheap.

The Messrs. Hodge & Co. make a fine exhibit of their goods at the Pavilion, near and just to the right of the fountain.

Why is a fashionable young lady like a sportsman? Because she bags the hare.

Wellington's Vegetable Cutter.

The want of cheap portahle machinery for converting vegetahles into feed, has long heen felt,—a necessity that has been hut partially overcome by suhstituting hoiling in large kettles, which, besides heing a great inconvenience, is often expensive, the construction of a furnace, and the purchase of hoilers costing much more than the invention of which we speak — the Pacific agency of which is represented by Mr. F. B. Lamh, at 116 Jesse street, who has one of these cutters in the Fair, near the silk exhihition.

The construction of this machine, as illustrated in the ahove cut, is very simple, and its action easy, reducing the vegetahles to suitahle fineness with little labor. The cheapness of vegetahles as feed for horses and neat stock, has not been availahle here to any considerable extent, for want of just such an invention. A change from the juceless grass fodder of the dry season to a partial feeding of vegetahles, must result favorahly in tho raising and fattening of stock for market, lessening the cost and improving the quality. It may also stimulate the raising of vegetahles in certain localities where, without a cheap way of reduction, they would not be available. The machine cuts turnips, carrots, heets, potatoes, Wurtzels, pumpkins, etc., with the same ease, into gouge-shaped pieces, most suitahle for mastication. Thers are two sizes manufactured, the one on exhibition being of the smallest capacity. The largest is adapted to horse-power, with hopper capacity for four hushels.

The agent mentioned ahove is a stirring and experienced one, and we are pleased to see him successful in selling so meritorious an article. The cutter is just what is wanted in a fast conntry like ours, where beets frequently grow over 100 lbs. in weight. It would be cruel to force cattle to swallow them whole.

What are "Brazilian Pebbles?"—A special feature of Mr. Houseworth's exhihition of optical instruments aud optical appliances at the Fair, which has heen overlooked, is his showing of Brazilian pebbles, and of the pure and perfect lenses which are manufactured therefrom. They are nothing hut pure crystallized silica without a flaw, and are not necessarily all Brazilian, hut as they have been found plentifully and very perfect in that couutry, a trade has sprung up for the supply of the London and Paris lens manufacturers, who pay good prices for the mineral. Spectacle lenses were formerly all made of common glass, but they have been found to be much less pure, and at the same time to be more inflaming to the eyes, than the pure and cold natural product of the caverns of the earth. An examination with the tourmaline tongs or "pebble trier" shows common glass to be almost dark, where the rock crystal is luminous; and ou touching them both to the tongue there is observable at once the most marked difference as to temperature. Brazilian pebble glasses cost the manufacturers ten times as much as the ordinary glasses, yet the price at which they are sold is only four times that of the latter—viz., $6 and $2½ respectivcly. It is certainly unwise economy that would suhmit so delicate an organ as the eye to the use of imperfect or irritating glasses. For old people, there is a new thing exhihited, which is founded on a correct principle—a glass ground, with a different focus on the upper half from that of the lower half, adapting the spectacles to seeing both distant and near objects.

Scraper and Tube Cleaner.

The following is the patentee's claims and description of the novel and ingenious invention herewith illustrated. It is the cheapest, best, most durable, easiest to adjust, and cleanest apparatus to use for ths pnrpose designed, yet offered to the puhlic. Being constructed on simple and mechanical principles, it is not liahle to get out of order, and will continue to perform its office until the materials are worn ont. It can readily be adjusted, even by any inexperienced person—will scrape off ths scales and cleanse the tuhes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes.

A coutinuous iron rod runs through ths center of the top and hottom hubs. Ths soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod, with a set screw in it to fix it firmly on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliahle material, is attached to the nut for the purpose of removing from the tube tho scale and dust loosened hy the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensivcly used in the Eastern States. Quite a nnmher havs already been sold at the Union Foundry, Sacramento, giving the best of satisfaction. They are on exhibition at the Mechanics' Fair, by McAfee, Spiers & Co., boilsrmakers, Howard street, betwcen Fremont and Beale.

Position of the Wrist in Playing.—The "Piano Pupil's Monitor" is a device suggested by J. D. Patrick, a teacher of experience, for the purpose of insuring a proper position of the wrist in playing ths piano. A correct habit in this respect is deemed of importance to the permanent progress of the student. A bar or other contrivance attached to the piano, in front of the keys, for the support of the pupil's wrists, is by no means a new invention; hut a strip armed with a bevel edge, not sharp enough to do any injury to the wrist, yet possessing a sufficient edge to render it an uncomfortable support for the wrist, ia claimed to possess both novelty and utility. Many distinguished professors have given their verdict against the use of any snpport for the wrist, and probahly no permanent benefit can he derived from the nse of such a support; but there could be no harm in having something which would remind the pupil when the wrist might be too low, without serving as a support for the wrist. Teachers or parents who may desire ths Pupil's Monitor can economize hy leaving orders with the inventor, 326 Mason street, near Geary. The invention may be seen on Mr. Rudolf's piano, at the Mechanics' Fair.

First-Class Groceries are not only ths best, but really the cheapest. The waste on second ratc provisions, on an average, more than equals the difference in price. Give your orders to Bowen Bros., and you will get value received, not once, but every time.

[From the Mechanics' Fair Daily Press.]

OUR BRASS FOUNDRIES.—In its review of the Fair, tho *Morning Call* gives the following in referenco to this important branch of local manufactures: There are several brass foundries in San Francisco, aud each one makes a very respectable exhibition of articles manufactured by them. Some of thaso foundries were commenced in 1850, at which time they manufactnred only tho commonest style of work; hut as they grew older they advanced, until at tha present tima all articles in that line can be produced of as good quality and finish as can be found elsewhere. At first the business was subject to the great drawbacks of high wages, ronts, and interest on money, as compared with tho same trade in the Atlantic States, while importers made vigorous competition to supply the demand. By hard work and close economy, our local manufactnrers, however, succeeded in establishing a prosperous business, and during tho past five or six years hava been ahle to undersell the importers of Eastern work in many articles of tha trade. All varieties of work have been made, including the casting of bells of considerahle size, of good volnme of sound and tone. The general consumption of brass goods on tha Pacific coast is estimated by competent judges at from $230,000 to $250,000, of which our local foundries supply over three-fifths. The most extensive display at the Pavilion is mada by W. T. Garratt, whosa foundry is on the corner of Fremont and Mission streets. Amongst the articles exhibited are steam whistles, valves, gauge cocks, water-gaugea, gongs, oil pumps, nails, butts, etc. They have also two of Col. Buckley'a deep-sea sounders, designed by himself, and mannfactured for him by this firm. He used them in making soundings for the Russian telegraph cable. They also exhibit several of Roscoe's patent oilers for luhricating engines, and which are intended to make the supply of oil to the friction parts of machinery as regular and constant as Nature supplies tha lubricating fluid to the joints of animals. Two cannon, mada for tha Telegraph Expedition, ara also exhihited. They are very fine specimena of workmanship, and attract no little attention from those who visit the Fair. This firm hava been engaged in business in San Francisco since 1850, and havo now some forty men employed.

Messrs. Gallagher & Weed, of the California Brass Works, also make a very fine display of articles manufactured hy them. Their articles are pronounced, by competent judges, to be fully equal to any imported. This firm employ about twenty men, and hava made arrangements for augmenting their force. With such workmen as the above in California, it is folly for our people to patroniza Eastern manufacturera.

SURMISES CONCERNING THE OBJECT OF THE CHINESE EMBASSY.—One of the many rumors which have obtained currency in Europe, as to the object of the Burlingame-Chinese mission in that country is, that they desire to secure co-operation for the opening of a ship canal through the Isthmus of Darien, to which China is willing to contribute $15,000,000. The dispatch of such a mission shows an advance in knowledge at Pekin, which is difficult for Enropeans and Americans unacquainted with the country to realize; but it is well known that the Imperial Government, from which Mr. Burlingame derives his commission, has been pressed so sorely by the rebels as to ba in danger of dissolution, and the Emperor's counsellors may well be conceived, under the pressure of events, to have seen the force of auch points as that wida-awake American would be likely to have presented to them, and determined as a last resource to cultivate tha arts and commerce of civilized nations, or even to hid for the friendship and aid, if not the intervention, of the powers which they are well assured control the world. Bancroft & Co., pnhlishers.

NEW LAW OFFICE.—Thosa who may hava legal business in Yuha, Siarra, and Plumas counties, aluld taka notice that J. M. Havan, Esq., late District Attorney of Sierra, has opened an office at No. 25 Montgomery Block. His intimata acquaintanca with businaas and men in that section would ba of great advantaga to clients. We can endorsa Mr. Haven as prompt, capahle and reliable, having had buainass relations with him extending over a term of years.

WHY do woman lika stays? Because they feel so-lacad by them.

HUGHES, KIMBALL & Co'a TIRE UPSETTER.—This is a California invention, which has recently hoen perfected hy Mr. Wm. M. Hughes. It is the result of much study and thought, aud embraces a combination of mcchanical movements and principles which one would scarcaly expect to meet with in a machine of this description. No one thing has hean overlooked in its design or constrnction which could ha of any possihle advantage in tha important use to which it is applied. Ona of these machines can he seen in operation at the large carriage manufactory, corner of Fourth and Bryant atreets, and another may he seen at the Pavilion, whare Mr. Hughes, tha inventor, is generally in attendance, for the purpose of explaining its principlea and mode of operation.

The chief advantages claimed for thia over other machines of the kind in usa are tha following:

1st.—Tha power is mora direct in application, tha movemant being in a curve, to operate upon a curved form.

2d.—Tha lina of power is directly in the line of resistance.

3d.—It is ready of adjustmant and rapid in its operation.

4th.—One man may operate it alone.

5th.—The tire is held haneath a convex, to pravent huckling or kinking, while under pressnre.

6th.—The smoothness of tha outsida and edgea of the tire are praserved by a simple but effective device.

By a rapid shifting of eccentrics, the power of tha machine may be increased to suit tha resistance to be offered, without altering the length of tha lever.

The end of the lever, passing through a semi-circle instead of a quadrant as in many similar machines, the power is proportionately greater.

A GRAND PROMENADE CARNIVAL and Fancy Dress Ball is to take place under the auspices of the Board of Mauagers of the Mechanica' Institute, in the Pavilion, on Thursday evening, Sept. 17th, 1868. The Committea announce that immediately after the removal of all articles from the Pavilion at the close of the Fair, a magnificent ball room floor will he laid, 21,000 square feet, covering the entira space under the nave, with tha axception of the fountain, which will be in full operation, on the night of tha hall. The Pavilion will be illuminated on this occasion, hy 1,300 hurnars. The left wing front of the bnilding will he converted into a ladies' reception, and the right wing, corresponding, into a gents' reception. The apaca allotted to tha display of woolen and furniture, will be altered into rafreshments and supper rooms; and the spacious art gallary will ba comfortably arranged as a drawing room, which can be used by those who desire to withdraw temporarily from the buatle and excitement of the carnival. Tha promenade gallery will remain intact, and will afford a brilliant view of the entira dancing floor. An orchestra of eighty performers has heen engaged. Supper will ha served a la carta.

Two prizes will be awarded by a committea of well-known gentlemen, chosen for the purpose, to the best lady and gentleman ccricature present, a beautiful set of jawelry to the lady, and a handsoma gold medal to the gentleman. It will ba understood that the prizes will not ba awarded of necessity to the best dressed lady or gentleman, but to those, who, if they assuma a character, best sustain it until midnight.

Tickets for dancars are fixed at $5, and for spectators at $1.50.

OVERLOOKED.—Owing to the absence of any classified catalogue, it has been impossible, until within tha last day or two, for any one to know what there was on exhibition under any given class, otherwisa than by hunting tha articles together, scattered as thay ara throughout the entire Pavilion. Our general review having heen made out necessarily in that manner, it could not happen otherwise than that some important or nnimportant things, should hava been unintentionally overlooked. Amongst these we have diacovered Millar'a adjustabla aaw taeth, referred to in another paragraph; Pointer'a leather trunks, a splendid pyramid of richly suhatantial goods, of puraly homa manufacture; French's ditto, in tha sama naighborhood, and equally imposing; and Mrs. Winship's millinery—a fine display of tasteful ladies' honnata, and artificial leaves and flowers, amongst which we noticed with delight the native white harehall or "snow-bell" of the foothills of the Sierra Navada, which ia found nowhere elsa in the world, so far aa wa are awara.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 4, 1868.

We give the following as an approximate price at which copper ores can now he sold in this city. There is no sale for ores which assay leas than 12 per cent. The late reduction in prica is on account of the advance of freight:

		Per ton.			Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 62	23 " "	48 45
14 " "	20 20	24 " "	49 33
15 " "	23 35	25 " "	52 22
16 " "	28 23	28 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	68 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will he found substantially correct, and can ba realized at this date.

EMBOSSED LETTERING.—Some very fina specimens in the way of signs, of emhosaad lettering on glass, are on exhihition by Messrs. Noble & Gallagher, housa and sign painters, 437 Jackson street. The difference between this atyle and the ordinary gilding, is, that tha letters are raised, and cannot be effaced. The gold is much richar in appearanca, and at the same time far more enduring and beautiful, while tha cost for the naw styla is but a small percentaga in advanca of tha ordinary gilt. That beautiful sign of H. M. Nawhall & Co. is axacuted in this way, and is done in the finest styla of the art. Tha plain gilt aigns of this firm are clear, bold and solid in the lattering, in this respect in striking contrast with much of aimilar work to ba seen throughout the city. Tha three splendid sampla letters, B A T, were inadvertently attributed by our reportar to H. M. Newhall & Co., instaad of to Messrs. Nohla & Gallaghar, the exhibitors.

SPIRIT LEVELS.—P. Qnigley, 922 Market street, has a case of tools at tha Fair which is well worthy of mention among our minor home manufactures. We would call spacial attention to his spirit levels, every part of which, including the glass tuhea, is turned ont by his own hands, and owing to their acknowledged excellenca hava nearly supplanted the imported articla. Tha alcohol used is of the very baat quality. Thay ara consaquently much mora sensitiva than similar levals in the market in which banzine or common apirits hava bean used. They are made of California laurel, and Mexican rosawood and mahogany, preasnting a finished and workman-like appearance.

WHAT is that which can often he found whera it is not? Fault.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Union*, Aug. 22d: The contractor on the Mt. Bullion tuanel hopes to fiaish his first 500 ft. in four or five weeks more.

Chronicle, Aug. 22d: Yesterday afternoon a large body of fine looking quartz was struck in the Rippou tunnel in this towa. The ledge was run iato a distaace of two feet. If this strike proves as good as anticipated, the compaay will erect a mill immediately.

Amador County.

Jackson *Ledger*, Aug. 29th: Prospectiag on Old Bob's quartz claim in Walker's field is being pushed forward vigorously, and every day looks better and better. They now have a ledge 10 ft. wide, and the rock shows a great deal of free gold.

The chloriaation works at the Coaey & Bigelow mine are agaia in operation. The new furnace stands the heat well, and we expect shortly to record a handsome yield from the sulphurets taken from that mine.

Butte County.

The *Bulletin* of this city of Sept. 20th, has the following: We have been shown a round water-worn cobble of quartz, about twice the size of a dumpling, thickly veined and nearly one-half covered with gold, which was found last Friday in the Lincoln tunnel, at Indian Springs, Butte County, about 1,100 feet back in the drift, 2,500 ft. below the top of the hill, and 800 above the bed of the Big Butte Creek. This cobble contains about five pounds of gold, of a quality worth $18 per ounce, and its total value is probably abont $1,080. The owner of the mine from which this nugget came is Robt. Kirk, and he states that he has in the dump, gravel that will yield $4,000 as soon as water can be had to wash it out.

Calaveras County.

Mokelumne Hill *Chronicle*, Aug. 29th: The Rich Gulch correspoadent writes:

Mr. Staple is pushing things with an energy that is truly amazing. Iadependent of the regular force of miners, whim tenders, mill feeders and others, a large number of men are employed under Milo J. Ayer, erecting another battery of 8 stamps, making 16 when completed. Another large farce of men under the superintendence of S. A. West, are engaged iu erecting sulphuret works which are expected to be completed and in operation by the first of September.

Adjoining are the works of Alexander & Co., who have just completed their hoistiag works and have resnmed sinking their shaft, now 120 ft. deep. The ore uow beiag extracted from the mine is of a higher grade than ever.

Next to Alexaader & Co., north, is the claim formerly known as the Norton claim, now owned by Mr. Smith, of Grass Valley, who bas let a contract to run the tunnel 60 ft. further, and the work is already progressing.

Lamphear & Co. have again commenced work on their claim in Spring Gulch. The water in the shaft is being pumped out preparatory to the resumption of active operations. The shaft which has been sunk ou the claim is 130 ft. in depth, and a lead six ft. in width developed at that distance.

The "Petticoat" mine, at Railroad Flat, "pans out" better than that indispensable article of female attire ever was known to do before. Some rock recently crushed from that lead yielded $150 per ton. As the shaft descends the vein increases, both in width and richness. Mr. Said, the proprietor, is pushing forward work upon the claim, and will soon have it in a condition to commence takiag out ore in good earnest. As soon as this is accomplished a large mill will be erected. As the proceeds of a run of about two weeks, with eight stamps, Mr. Said brought to this place yesterday 102 lbs. of gold dust.

A dispatch to the Marysville *Appeal*, dated San Andreas, Aug. 29th, says: The Union copper mine, situated at Copperopolis, was sold to day at Sheriff's sale to Glidden & Williame for $121,251 iu currency, or $118,954 in coin.

Kern County.

Havilah *Courier*, Aug. 25th: We take pleasure in annouacing the discovery of a vein of surpassingly rich quartz in the Relief mine. The ore is literally bespanged with gold, and there is now every prospect that the long cherished hopes of the owners and workers of the Relief lode will be realized. This discovery not oaly promises a fortune to the company, but gives encouragement to all engaged in miaing enterprises in this couaty. It is not possible that this is isolated, and it is the deliberate opinion of well-informed parties that there are many other lodes of equal richness when the proper depth is reached.

Mariposa County.

Mail, Aug. 28th: Our mouatain correspoadent, writing uader date of August 24th, says: We visited the newly discovered quartz mine knowa as the "Harbour Miae," on the Buckingham Monntain. The vein is about nine feet in width, and has the appearance of good pay rock. Some of the timbers of the proposed mill are already prepared.

Gazette, Aug. 28th: The contract for lumber to build the dam at Benton Mills, was let last week to Smith, Dudley & Co., of Coulterville; the amount is $15,000, with a forfeiture of $250 per day if the lumber is not delivered ia the time mentioaed in the coatract.

Nevada County.

Transcript, Aug. 26th: The Lower Channel Co. has located 3,000 ft. ia the channel of Squirrel Creek, in Pena Valley. This ground is located immediatcly below the Chanael Co's location.

Aug. 27th: A rich quartz lead was struck by Williams & Co., ou Peck's raviae, on Monday last. The ledge was worked some 12 months siace and first rate prospects were obtained. They crushed 60 or 70 tons and it paid from $15 to $23 per toa, but water coming in on them, and beiag poor mea, they had to suspend operations. A short time since the parties commenced sinking a shaft, and struck the ledge 26 ft. below the surface. The ledge at this point is considerably decomposed, but is well defiaed and five feet wide. They have taken out two tons of rock going through the ledge. We saw a prospect from one-fourth a pan of quartz valued at about $2. If the ledge holds out as good as it looks, by the time they reach water they will have enough to pay for machinery.

R. C. Black has been wasbing in his claim at Bloomfield this season with first rate success. He is now engaged in cleaning up the tail-sluice and building walls in order to confine the water to the chanael for effective work when the raias come on.

Gazette, Aug. 27th: The last clean-up of the Eureka, after a run of two weeks on a comparatively poor class of rock yielded $19,300.

The average yield of the ore from the Idaho mine is $47 per ton.

Grass Valley *National*, Aug. 25th: The Forest Spring mines, notwithstanding little noise is made about them, continue to be quietly worked, and to yield well to their owaers. At Perrin's mine they are sinking, and are down 300 feet on the incline. The rock shows well. The Grant ledge, which is being worked on shares, continues to produce excelleut rock. The last crushing yielded $75 per ton. The Shamrock is not as yet much developed, the miners only being down about 25 feet, but they are taking out good rock, and the mine has paid from the surface.

Aug. 27th: The Hope Gravel Co. have sunk a shaft to the depth of 214 feet, and are now runniag two drifts; one under the gravel through the bedrock, for the purpose of drainage, and another, the West drift, to strike the main gravel channel. This latter drift is now 200 feet in extent, and it is expected that the gravel will be struck after runniag about 100 feet further. At the present rate of progress, this will take about four weeks. Not much gravel is being taken out at present, but what there is prospects finely. The gravel is broken up aad ground by a mill, workiag on the principle of the old arastra, which pulverizes it so that when it passes into the sluice-boxes, every particle of gold is at once seized by the quicksilver aad saved. This mill is carried by a small steam engine of 16-horse-power.

Grass Valley *Union*, Aug. 26th: The Banner Co. of Nevada City have resumed work, their new boiler for the hoistiug works beng placed in position.

Aug. 29th: The new ditch, which the Bloomfield Co. is coustructing, demands 1,000 additioaal laborers, and the company are hiring all the Chinamen they can get.

EXCELSIOR.—*Transcript*, Aug. 30th: A private letter recently received in this city from Meadow Lake, states that the Mohawk & Montreal Co. are now taking out better rock than had been obtained siuce the district.

Transcript, Sept. 1st: The Rising Star mine, on Deer Creek, is yielding very rich quartz. We were shown yesterday a specimen which measures more than a foot in diameter. It was streaked with pure, bright aud glistening gold. The ledge is about three feet in thickness, aud the richest rock is of the character of the specimen just mentioned. The second grade of ore contains more sulphurets but pays well. The specimen was taken from the new incline, 260 feet below the surface.

Gazette, Aug. 31st: A fine specimen of gold-bearing quartz was brought to the Union Hotel on Saturday. The specimen weighs some 70 or 80 pounds, and the free gold shows beautifully. The ledge is affording most excellent ore, mostly of the sulphuret character. The owners have out now nearly 200 tons, which is being hauled to mill, and will soon be crushed.

Placer County.

Herald, Aug. 29th: Sincox & Co., who own the galena ledge, on Antony Ravine, had 15 tons of surface rock crushed at the St. Lawrence mill, below Ophir, some 10 days ago, which yielded $20 per ton in free gold. This company have now at Schnable's mill, some 18 tons of their rock.

Dutch Flat *Enquirer*, Aug. 29th: All the mining claims of this vicinity have suspended operations for the present season, the last one, the Jehosephat, hauled off during the early part of the week. Mr. Beals has quite a number of men engaged cleaning up his large flume in the canon below town, and when this is finished the mining hereabouts will be confined to preparing for the coming season. The Jehosephat paid during the last run, at the rate of $100 per day.

At last, prospects are fair for the erection of a mill on the blue lead.

Plumas County.

The North Fork correspoudent of the Quincy *National* of Aug. 22d, says: Balliette & Boston are preparing to work the Last Chance Claims at Bamboo Bar. John McBeth is fitting up to work the ground where his store now stands on Marion Flat. The Brewster Bros. have sold their claims on Red Rock, and gone east. On Dutch Hill the miners are all busy. The Dutch Hill Co. are doing well. Benham & Bly are taking out some rich dirt. Wagoner & Ferguson, Mechlin, aud Bryan & Emmons are all taking out some gold.

Turner, Reynolds & Co., of Black Hawk, cleaued up this week the sum of $1,600.

Sacramento County.

Folsom *Telegrayh*, Aug. 29th: A couple of miners at Willow Spring Hill, recently washed up the sum of $5,400.

Sierra County.

Downieville *Messenger*, Aug. 30th: The Monumental claim ot Howland Flat, is reported as still paying well.

The owners of the Hawkeye claim at Howland Flat have commenced the excavation of a drain tunnel, which will tap their well known rich ground at its lower end.

Siskiyou County.

Yreka *Union*, Aug. 29th: The Trinity Valley correspondent writee: The mining prospects of this place are very good, and many places are satisfying the highest expectations of their fortunate owners. James Murray has just reached the pay streak in his claim, a little south of Trinity Center, aud from all indications he is destined to take out good pay.

Tuolumne County.

Sonora *Democrat*, Aug. 29th: On Friday afternoon, the quartz mill of Fry, commonly known as the "Fry & Comstock Mill," caught fire, and was entirely consumed. This mill was situated at the Fry & Comstock Mine, near Calder's Ranch, iu the mountains, about 10 miles east of Sonora. It was run by steam and worked 10 stamps. Insured for $6,000.

A party is about to prospect the head waters of French Creek, in the New River range.

Yuba County.

Marysville *Appeal*, Sept. 1st: We saw yesterday at Knight & Co.'s assay office, a golden brick containing nearly $5,000 from the Pennsylvania Mine at Brown's Valley. The company are taking out from $400 to $500 per day.

COLORADO.

Central City *Herald*, Aug. 12th: H. B. Barstow, of Lake Gulch, has commenced the erection of a 20 stamp mill, on the Smith & Chaffee mill site. He is still prosecuting work on the Bobtail lode, and has had a very heavy cap-rock to work through.

Gregory Mill No. 1—20 stamps—started up yesterday morning, on ore from the Black Hawk Co's claims on the Gregory.

The Pleasant Valley G. M. Co., Russell Gulch, have the breaks in their gulch claims repaired, and will soon resume gold shipments. This morning Mr. Owens brought down 40 oz. of gold for shipment, the product of last week's run. Their production of gold for the week ending Aug. 1st, amounted to 130 ozs. Above them, William Queen, White & Co., and others, are prosecuting work with success.

Thos. H. Craven struck it last week on South Clear Creek. They have found the pay streak in the old channel of the creek, and have enough ground to keep them engaged for years. The Dr. brought over about six oz. of the most beautiful augget gold we have ever seen.

The Lexington mill is being run from surface quartz from different lodes. From a cord of ore from the Seymour lode, run through last week, there was cleaned up nine ounces, seven penny weights and three grains of gold. It was very bright gold, and brought $22 per ounce. The shipment of gold from this place for the month of July amounted to $366,250.

At Peru, Daly is working the National Treasury lode, which looks well....Dr. Laptoa has boaght Negro gulch, including Lead lode, for $15,000....The Virginia lode, in Pollock district, head of Blue river, is being worked, and is paying well. They have a stamp mill there....Capt. Walker expects to start his mill in Finder gulch, shortly....At Montezuma, Capt. Slawson has "struck it big" in his tunnel....Gov. Steel has discovered the lode which furnished the gold to Delaware Flats and Hughes gulch.

Central City *Register*, Aug. 12th: The great excitement concerning the new discoveries at the head of Bard Creek continue.

A bar of silver nearly pure, worth $770, is on the counter of the banking house of Geo. T. Clark & Co. It was extracted from the ores of the Astor lode, by the German reduction works, Georgetown. A finer looking bar has not been extracted in Colorado.

Matt France informs us that the new mines above Empire and south of Clear Creek, are very rich and have very wide veins, the width running from 5 to 20 ft., while the assays run up high into the thousands. Sulphurets of silver and ruby silver are found on the surface.

Cooper, Craven & Branch, at South Clear Creek, have again struck rich pay in their claim just below the Spanish Bar bridge.

From the 6th of July to date the German Reduction Works, at Georgetown, shipped 13 bars of silver bullion, weighing 5,697.47 ozs., worth $5,317.33.

Denver *News* Aug. 12th: Clark & Crow have out another half dozen tons of Terrible ore, worth between $4,000 and $5,000.

A new discovery has been made near Red Mountain, in the forks of Clear Creek, which is creating considerable excitement.

In California gulch, Burt Bros. have made a clean up, which yielded at the rate of 1¼ oz. per day to the man.

Burt & Lumkin have cleaned up 10 ozs. from 12½ days' work.

DACOTAH.

The Idaho *World* says: Mr. Wright, an old pioneer of Boise Basin, left Sweetwater about a month ago. He pronounces the mines of that region, both quartz and placer, to be of a very inferior class. Big reports had attracted thousands of people there, but almost general failure in finding anything like good paying mines, has thinned down these thousands to an exceeding'y sparse number. Three months ago there were between 5,000 and 6,000 souls in that region; when Mr. Wright left there were not more than 100 in all. Among these were Comstock (of Washoe fame), and Dr. Wilson, formerly of this Basin, who had small claims which paid only about $5 per day. The area of the mining district does not exceed ten miles square. The miners are about half Geatiles and half Mormons Chas. Tozer, an old California miner, has a five-stamp quartz mill in operation, crushing custom ore, but with small profits, and indifferent prospects.

Sweetwater Mines, August 8th: In a late issue of the PRESS we published an item clipped from an Idaho exchaage, stating that this paper was defunct. We are pleased to note its appearance, which refutes the former statement, especially as it contains some interesting mining items. [EDS. PRESS.

The six-stamp quartz mill owned by Tozer, Roberts & Co., after a run of a little over a week, crushing 162 tons of ore, made a clean-up yesterday, and obtained results highly satisfactory to all parties concerned.

The Bob Tail Ledge, in Shoshone District, upon which a shaft is sunk to the depth of twenty feet, and 6 by 8 feet in width, is well defined with both wall rocks in view. The ore is of the first quality, although it does not exhibit as much free gold as many other ledges here, yet a good prospect can be obtained from any of the quartz which has been taken out.

Pease & Co. are erecting an arastra on Rock Creek, near Atlantic City, to crush the quartz taken from the Cariboo ledge, which will be completed and at work next week. The ore from the Cariboo is very rich indeed.

IDAHO.

Owyhee *Avalanche*, August 15th: Dan Powers and partner, in overhauling the

refuse material at Golden Chariot dump have, with a set of sluices and a small head of water, managed to make $1,200, besides saving 9¼ tons of ore, which has been worked in the Wehfoot mill, yielding the sum of $2,438.

John Donavan has discovered a large and rich ledge, opposite Webfoot Gulch. It is called the Peru, and is 3½ or 4 feet wide.

The Wehfoot mill is now running on Woodstock ore with encouraging paying prospects.

The Cosmos mill will start up the beginning of next week on ore from the first south extensive of the Silver Cord.

The Ida Elmore Co. have stopped work on the mine for a few days—until their new hoisting works can be erected and put in working order.

August 22d: The Iowa and Idaho Mining Co. have resumed operations in Flint.

A party is now being organized in town for the purpose of prospecting the country in the vicinity of Goose Lake, Upper Pitt River and thereabouts, for both quartz and placer diggings.

Work is now briskly progressing on the Oro Fino mine. On the dump there is a good heap of ore.

Work has been resumed on the Surplus Oro Fino. The small steam engine recently used at the Ida Elmore is now employed on the Surplus.

World, August 19th: We saw 283 ounces of gold dust, the yield of 40 days' run, by 4 men, in the claim of the Ward Bros., near Warren's; but this was deemed a very rich clean up. The average wages are from $5 to $8 per day to the hand. The dust is all nicely cleaned throughout the camp, and readily sells at $13 per ounce.

MONTANA.

Helena *Post*, Aug. 21st: Prof. Steitz, at the First National Bank Assay Office, yesterday smelted 938 ounces of gold, valued at $18,239 in coin. Among this was the gold from the Cabin ledge, which after smelting, weighed 356,65 ounces, was .903 fine, and worth, $6,657 46 in coin.

Nearly two miles of Silver Creek Gulch is owned by three drain ditch companies, two of which are making average runs of from ten to twelve dollars per day to the hand. The third has not yet reached bed rock, but its ground prospects well.

Samuel Hauser informs us that the mill of the St. Louis & Montana M. Co. at Phillipsburg, is extracting daily from the ore $1,000 worth of silver.

A correspondent from Radersburg writes: "We want 300 good men to prospect in the Big Horn and Wind River Mountains. For several years the country referred to has been thought to be one of the richest in America.

Mr. Gibson, of Hog 'Em, informs us that water at that place is plenty, and that the mines are paying well.

Virginia *Democrat:* The "Cedar" lode, recently discovered in the Silver Star, prospects, in exceptional cases, $15 to the pound. Everett's mill, in the same district, is nearly completed, and will soon commence crushing on the Green Camphell Lode.

The Deer Lodge *Independent* gives the following: The Carihoo Co. have several strings of sluices in operation, each paying from $100 to $200 per day. New diggings have been struck in Boomerang Gulch, which well pays to wheel the dirt for purposes of washing. Bed rock has been struck in Uncle Ben's Gulch, and a prospect of $1 75 to the pan obtained. Times lively at Highland. New diggings discovered this side of Gold Creek. Newly opened mines paid at the first run all expenses, with water at 22 cents per inch, and netted a profit of $10 per day to the man. Stampeders are passing through Missoula in large numbers on their way to new mines, supposed to be in the Bitter Root district. Mining has almost entirely ceased at Butte for want of water.

NEVADA.

Esmeralda.

Aurora *Union*, Aug. 22d: From Pine Grove we have the following: The companies which have been at work during the spring and summer continue their operations, and are contented with the yield of good paying rock. The camp holds its own very steadily, and there is no disposition to create unnecessary excitement. Only two mills are running at this time, and the shipment of bullion from these foots up from $4,000 to $6,000 per week.

Humboldt.

Unionville *Register*, Aug. 22d: The Elmira Silver Bullion Co. will soon be prepared to go forward with the development of the mine.

Winnemucca *Argent*, Aug. 27th: The shipment of Golconda bullion on the 15th, was 163 lbs., and on Saturday last another shipment was made of 165 lbs. In each case 16 ozs. to the pound.

Reese River.

Austin *Reveille*, Aug. 22d: For the week ending this date, there were produced at the Manhattan mill 51,867 ozs. of crude bullion.

Aug. 24th: Little lots of bullion were brought into the city to-day as follows: 982 ozs. from Ione, 1,638 ozs. from Columbus, and 1,184 ozs. from San Antonio.

The Eberhardt South, in White Pine district, is yielding ore of wonderful quality. Its owners have had 15 tons reduced at the Centenary mill, the assays of the pulp of which ranged from $1,330 to $1,389 per ton, and they claim to have 200 tons of similar ore ready for the mill. The reports from the district represent the claim as looking better than ever, and that great bunches of rich ore were in sight.

A ledge has been cut in the Toyahe Co's mine, and shows ore of a high grade.

Aug. 15th: The hoisting works at the Hattie mine at Yankee Blade has been purchased and will be transferred immediately to the Chase mine.

There is a good deal of amalgam and quicksilver lying around loose in this cañon, quantities of which are occasionally picked up by the skillful and industrious. Within the past few days some Mexicans obtained from the bed of the cañon about 50 lbs. of quicksilver, besides washing out amalgam enough to yield a bar of silver of the value of $70.64.

We saw to-day at the National Bank lots of half dollars, which were the coinage of bullion produced by the Hidden Treasure mine in the district of White Pine. The first ore was taken from the mine less than 90 days ago.

Aug. 26th: From White Pine we learn that good ore is accumulating in a number of dumps, and the owners are looking forward for the completion of Page's mill to convert it into silver bars. All the machinery for the mill had been delivered on the ground.

Yesterday afternoon 12 bars of bullion arrived in this city from the Centenary mill. The bullion is of the average fineness of 851, and is valued at $13,800. It is the product of ore from the Eberhardt South, in the district of White Pine.

Some 19 tons of ore produced by the Garrison mine in the district of Cortez, which were reduced last week at the Manhattan mill, gave the average yield of $763 per ton. The ore from that mine appears to improve in quality as depth is attained.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Aug. 28th: The body of ore found in the Imperial mine in sinking a winze from the 700-ft. level to the 900-ft. level still holds out. The deposit is likely to prove of much valve.

Aug. 29th: During the past week there was shipped from this city and Gold Hill, 10,341 lbs. (a little over 5 tons) of assayed bars of bullion, worth $262,897.51.

Aug. 30th: The Sierra Nevada Co. cleaned up yesterday, after having made their first run with their new mill. It is the opinion of the Superintendent that the yield per ton will be between $16 and $17. A portion of the bullion extracted has been sent to California, and the remainder is still in the retort. The amount of ore crushed was 400 tons.

Sept. 1st: The Gould & Curry shaft is now down 1,050 ft., and yesterday morning struck into vein matter of a very favorable appearance. The dirt coming out contains much quartz that has the appearance of containing metal. The ground in which they are at present at work is composed too largely of soft decomposed vein matter to admit of a level being opened in it, and sinking will be continued until a more solid region is reached, when drifting will be commenced.

Trespass, Aug. 29th: Dispatched from Wells, Fargo & Co's office in Virginia, this morning, eight bars of bullion, weighing 562 lbs., and worth $15,454.33.

Wells, Fargo & Co. dispatched another gold bar to San Francisco, this morning, of the value of $1,268.70.

The new mill of the Sierra Nevada Co. was cleaned up yesterday. The first run consisted of 400 tons of rock, which yielded $6,750, or $16.87 per ton, not including the sulphurets caught upon the blankets, which have not yet been cleaned up.

UTAH.

Salt Lake Evening *News*, August 15th: The work on Sharp & Young's contract, in Weber Cañon, is progressing, and the men are about to receive their first pay.

At what time should an innkeeper visit an iron foundry? When he wants a *barmaid*.

Mechanical.

Krupp.—The New York *Iron Age* translates an interesting letter from a gentleman in the employ of Mr. Krupp, at his mammoth steel works in Essen, Prussia, a portion of which we quote: "Until now, the steam power of nearly all the old rolling mills in Germany, England and France has been much too light for the work required of them. From day to day the demand for greater productions increases, and a large number of rolling mills cannot respond, because their steam power is not great enough. In my calibre rolling mill I roll out cast steel blocks of 5,000 to 10,000 pounds weight. [The Prussian pound is heavier than ours.—Ed.] I also manufacture daily 450 to 500 cast steel rails, of 5 cwt. each, thus making a total of one quarter of a million pounds per day. This quantity I roll out in twelve hours in a rolling mill with three rollers. As soon as the rails are cool they are placed on six straightening beds and carefully arranged; after that, twenty-four saws work in cutting off the raw ends. As soon as they are of an equal length they are perforated and sent away for transportation. The rails are made of Bessemer cast steel. The blocks are cast of a weight of 5,000 to 10,000 pounds. After casting, they are taken to a forge, where they are first placed in a furnace and then placed under a trip-hammer of 400 cwt. falling weight, and beaten into an octagonal shape. After this, I take the casts to my calibre rolling mill, when they are first brought to a red heat and then rolled out into bars seven inches thick and eight inches wide. These bars are about fifty feet in length. They are then again brought to red heat, and then placed in a forge, where they are divided into pieces of suitable size for rails. For a rail 21 feet in length I require about 530 pounds of raw steel; thus one ingot is divided into ten to twenty rails. I take the pieces to a rail rolling mill, heat them, and afterwards roll them out as before described."

Wire Cables.—The aggregate strength of the four cables in the suspension bridge below the Falls of Niagara is about 23,878,400 pounds. Each of them is ten inches in diameter and contains seven strands, each strand having 520 wires, of No. 9 wire gauge. In describing the manufacture of such cables the *American Artisan* says: "The very best iron is selected, and the bars are drawn down at a welding heat to wire about one-fourth of an inch in diameter. This is then cleaned in warm acidulated water with a little oil of vitriol, and being coated with a paste of rye flour, it is drawn through a succession of holes in a wire plate until it is reduced to the thickness of No. 5, when it is annealed by heating from five to eight hours, and is then cleaned and drawn down again until it is of the required degree of fineness. In general ropes are made of strands, each of which has three, seven or nineteen wires, the ropes having either nine, forty-nine or one hundred and eighty-eight wires. The important considerations in laying them up are to keep an equal tension in all the wires and to prevent their being twisted as they are laid into strands, and that the strands also should be equally free from twist as they are laid into ropes."

Improved Gas Engine.—The principle upon which the gas engine invented by Messrs. Mazieres and Trottier is based, consists in the condensing or cooling the burnt gases after their action on the driving piston. The object is to produce the vacuum behind the piston. This condensation takes place in a condenser, either by means of an injection of cold water, by surfaces cooled by a current of water, or by any other agent capable of producing cold. This engine may be of single or double action, with two or more cylinders, according to the work to be done. It is single-acting when the introduction of the gaseous mixture takes place only on one side of the piston, double-acting when it takes place alternately on each side. The distributing vessels are placed vertically at the extremity of each cylinder; they are set in movement by levers in connection with the horizontal shaft of the engine; they comprise a mixed gas chamber, an air reception chamber, a firing chamber, and an escape chamber, all provided with two orifices, each one communicating at the proper time with the cylinder of the engine. A pipe communicating with the escape chamber conducts the gases issuing from the cylinder to the condenser, whence they are expelled by means of an air pump.

Scientific Miscellany.

Reflected Light.—In a recent lecture delivered by Prof. Henry Morton, at the Philadelphia Academy of Music, before the Franklin Institute, and reported by the *Journal* of that Association, the difference between regularly and irregularly reflected light was illustrated in an ingenious and entertaining manner. The lecturer directed attention to a large mirror behind him. Upon this mirror, the vast audience saw itself, with its fair faces and fluttering fans, duplicated. A lighted candle was then held near it by the lecturer, to prove, if necessary, by its twin image, that the mirror was really a valuable reflecting surface. He then informed them, that there was beside, upon that mirror, a beautiful phantom form,—invisible to him as well as to them,—but which would reveal itself if granted the protection of "this delicate white veil, which, as you see, is itself void of any marking upon its filmy surface." The veil was then, by an assistant, dropped in front of the mirror, and by means of a rod held closely against its surface. At once a beautiful figure of Ariel appeared.

The explanation was as follows: A magic lantern at one side, in full view of the audience, had been all the time projecting the image upon the mirror, at such an angle that it was thrown off obliquely and lost behind the side scenes;—the angle of reflection being equal to the angle of incidence, and the surface being one which was capable of regular reflection. But the veil changed this surface into one whence the rays were irregularly reflected, and scattered in all directions;—so that some from each point could reach the eyes of every one of the audience.

Rapidity of Chemical Action.—A. Vernon Harcourt, Esq., M. A., contributes an article to the London *Artizan*, on the rate at which chemical action takes place. The examination of different examples of such action, with certain experiments which he has performed, have led him to the following conclusions:

1. The rate at which a chemical change proceeds is constant under constant conditions, and is independent of the time that has elapsed since the change commenced.
2. When any substance is undergoing a chemical change, of which no condition varies, excepting the diminution of the changing substance, the amount of change occurring at any moment is directly proportional to the quantity of the substance.
3. When two or more substances act one upon another, the amount of action at any moment is directly proportional to the quantity of each of the substances.
4. When the rate of any chemical change is affected by the presence of a substance, which itself takes no part in the change, the acceleration or retardation produced is directly proportional to the quantity of the substance.
5. The relation between the rate of a chemical change occurring in a solution, and the temperature of the solution, is such, that for every additional degree the number expressing the rate is to be multiplied by a constant quantity.

Lyell and Darwin.—In the tenth edition of his "*Principles of Geology*," recently published, Sir Charles Lyell adopts the doctrine of Darwin in regard to the origin of species. The book has been completely rewritten, and the opinions expressed in some instances essentially modified. In speaking of the reptiles, the author refers to the fact that some of the fossil groups are of a higher order than the types now in existence, giving "an example of a class which gradually advanced till it reached a culminating point, from which it has ever since been retrograding." Sir Charles concludes as follows:—"We have been fairly led, by palæontological researches, to the conclusion that the invertebrate animals flourished before the vertebrate, and that in the latter class, fish, reptiles, birds and mammalia, made their appearance in a chronological order, analogous to that in which they would be arranged zoölogically, according to an advancing scale of perfection in their organization.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:
Saturday Morning, Sept. 5, 1868.

Notices to Correspondents.

X. PLAIN.—The manufacture of concrete stone is very simple; the sand, chalk, or other mineral substance is mixed with a proper proportion of a solution of silicate of soda in an ordinary pug-mill, after which the mixture, which very much resembles in substance fresh putty rolled in sand, and is of a very plastic consistency, is either pressed into blocks or molds, or can be rolled into slabs or forms as may be desired. It is afterwards either saturated with, or immersed in a solution of chloride of calcium, on which a double decomposition takes place,—silicate of lime and chloride of sodium (common salt) being simultaneously formed. The silicate of soda is manufactured in digesters,—in which are placed calcined flints or sand, and caustic soda of sp. gr. 1.120, and heated below by means of a coiled steam pipe, supplied from a high pressure boiler. When this operation has been continued some time, the soluble silica formed is passed into a reservoir, from which latter it is drawn as required into pans, by which it is evaporated to a specific gravity of about 1.7,—which it is found by experience will suffice to afford the degree of viscidity required for properly cementing the loose ingredients employed, into a hard concrete substance. The best stones are composed of finely sifted dry sand. A small quantity of pulverized stone, or carbonate of lime, is added to the sand, to give to the silicate of lime produced in the manufacture the necessary closeness of surface for its cementing action. To each bushel of the mixture, one gallon of silicate of soda prepared as above described, is added; the whole is then thoroughly incorporated in a mill, which occupies about four minutes. The plastic mass so obtained is placed in molds and rammed firmly by wooden implements into the interstices; by which means all the edges, etc., present sharp rigid appearances. The forms so molded are subjected to the spray of a cold solution of chloride of calcium, which rapidly hardens the mass. The castings are next immersed in a bath containing a solution of chloride of calcium of sp. gr. 1.4, and temperature of 212°. After the last described operation, the chloride of sodium is removed by placing the artificial stone beneath a spray of common water. Some other particulars will be found in our issue of 22d August.

PISCATOR, San Rafael.—Fish are at various times attacked with devastating diseases. At the present time the gudgeons in the Seine (France) are represented as dying in enormous numbers. At Windermere, the largest lake in England, the perch are suffering from a like abnormal mortality, so much so that the pike and trout are said to be gorging themselves to repletion, and the fishermen who have been in the habit of setting baited night lines for the purpose of catching the latter named fish, are unable to snare them by this, one of their ordinary means of fishing.

CARBON, W. and C. and H. C. next week.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

SCIENCE.—Too many young persons pass through the course of study laid down in the catalogue, and thereupon enter the world believing themselves, as they are frequently looked upon by others, to be finished scholars, whilst they may be sadly deficient in the more practical and useful applications of science. To be able to understand ourselves and our surroundings, a practical knowledge of the exact rules of cause and effect which govern matter, is requisite. We may understand and be able to give scientific reasons for ordinary phenomena which would need but the second thought of ignorance to elucidate; yet we are by no means finished scholars. The want of the times is a more thorough course in the practical application of the dry facts of science in our public schools, so that instead of turning out a vast number of half-educated and bigoted scholars, to be starved and kicked through the world as clerks, or members of the over-crowded professions, we may have a sufficient number of persons familiar with special branches to secure a speedy and thorough exploration and development of the country. This is admitted to be a matter of vital importance. To the youth who acquires such knowledge, its possession will be of incalculable benefit. It will open up new fields to him, in which he may practice his natural genius, and he is not compelled to travel in the old beaten track. Superstitious lore must give way to truths that are the result of practical toil and thought by the living and moving minds of the day.

HO FOR THE NORTH POLE.—The telegraph on Wednesday announced another proposed North Pole expedition by the United States, England, Russia, and perhaps Denmark—the countries pecuniarily interested in the ice of that country. Whether the recent unusual number of sunstrokes have had anything to do with this matter, is not reported. The United States own twenty degrees of longitude on the arctic circle, England owns eighty degrees, Russia one hundred and sixty-five degrees, and Denmark from forty to ninety-five degrees—the ground not having been definitely located, owing to the inconvenience thereof, and there is left open, accordingly, a most eligible opportunity for squatters of the cold blooded type. The German Petermann expedition started from Bergen, Norway, in May, in a little clumsy looking sloop, commanded by Koldoway, with the intention of getting to the north along the eastern coast of Greenland.

INTERESTING TO MILLMEN.—The display of screens at the Fair, by the San Francisco Pioneer Screen Works, is one of the most complete we have ever seen. Among them is an assortment of flour mill screens, of all sizes in use, punched remarkably clean, leaving no bur on either side, and with a degree of uniformity not usually observed in screens. The flour mill jacket is made from the heaviest sheet iron used for this purpose, the holes being elongated, as best adapted to the use for which it is designed. There is also samples of a new cut screen, that is claimed as greatly superior to any make ever before used, inasmuch as the iron is less weakened, and they will not rip or tear, or fill up, and can be made much finer than any punched screen. They seem in general favor, on account of their strength, cheapness and durability, being already in use in quartz mills in Idaho, Nevada, Mexico and various parts of California, giving universal satisfaction, as we are told by Mr. Quick, the proprietor and manufacturer. Parties interested should call at his manufactory, at the Vulcan Iron Works, Fremont street.

DISTINGUISHED VISITORS.—It is reported that Professor Agassiz, Senator Conklin, and a number of Representatives of Congress, will arrive in this city overland in a few days. Those who have had the pleasure of meeting the amiable Professor in his best excursional vein, will be delighted to learn of his advent amongst the seekers of gold and silver on our shores.

The California Powder Works.

Passing down the main aisle of the Pavilion, on the left, we notice the samples of the California Powder Works. The peculiar nature of their business will not allow them to exhibit any great amount of their manufactures. They have therefore to content themselves with mere samples, as a larger quantity might endanger the lives of visitors who daily flock to the Fair. But, unpretending as is their display, it represents one of the chief manufacturing interests of the Pacific coast, and from these samples we gather the information that the range of their manufacture extends through all the kinds and qualities of gunpowder, from the very highest toned rifle, including all the grades of sporting, pistol, musket, cannon, mining, blasting, fuse and meal powder. On giving these samples a careful examination, we feel assured of their excellence, and they almost make us regret that the halcyon days of our boyhood have passed away, when, with the unerring rifle in hand, and a few jovial companions to join us, we have many a day worked ourself faint and weary in the exciting and real enjoyment of hunting.

We quote the following from a printed circular recently issued by the company:

"The California Powder Works are about entering upon their fifth year, as one of the leading manufacturing enterprises of the Pacific coast—their first powder being made in the summer of 1864—and they can truly say that their success has been beyond their most sanguine expectations.

An ordinary article of merchandise, in fact anything that can be handled and receive a critical examination, can make headway as soon as it is presented to a purchaser. But not so with an article like powder, where an inferior article can be made to look equally well with a superior—the surface and finish of powder being wholly produced by attrition of the particles, and a glazing of black lead.

For powder the miner must invest his hard-earned money; and after making expensive preparations, explode it in his mine before he can pronounce it good. In other words he must annihilate it before he can decide upon its quality. It is not strange, therefore, that he should strongly prefer some favorite brand that he has been in the habit of using, and is already prepared to be prejudiced against any innovations of the old and well-tried. Miners are surely conservatives.

These preferences and prejudices every new powder-works must meet and overcome, before the old will give place to the new.

It is, therefore, with pride that the California Powder Works can say that they have met with unprecedented success in the introduction of their manufacture, when the sales of their powder from being only a few hundred kegs in 1864, has reached to nearly one hundred thousand in 1867; and this in the face of the fact, that in all that period there has been an abundant supply of Eastern-manufactured powder of fair quality in the market.

While they have not aimed to undersell their neighbors, they have always endeavored to give their powder to the consumers at the lowest possible price consistent with the cost of its manufacture; and are confident in asserting that it has gone so generally into use, solely from its acknowledged superiority.

A careful test with a proof mortar, or balistic pendulum, will also satisfy the most incredulous that the various brands of our powder are from ten to twenty per cent. stronger than the same nominal grades made at other works, and which are subjected to a long sea voyage; and they confidently look forward for the time, not far distant, when every hunter this side of the Rocky Mountains will buy it in preference to that of any other manufacture."

We notice that most of the kegs and canisters exhibited are such as are in use by the company for putting up their powder for market, thus giving us a fair insight into their constant method of placing their goods before their customers.

These works are on the San Lorenzo river, about two and a-half miles from the town of Santa Cruz, or three from the Bay, where they have extensive warehouses for storing their saltpetre, sulphur and other merchandise; and their magazine for storing powder.

The works are very extensive, occupying an area of nearly two hundred acres of land, and comprise seventeen different mills and works placed at distances of from three to six hundred feet apart; besides workshops, furnace-houses for drying and for boilers, and storehouses for wood and other materials used in the manufacture of powder.

Their cooper-shop alone, where all their kegs and barrels are made, is a great curiosity, and will well repay a visit to any one who is so fortunate as to procure a pass to enter the gates of this establishment, with an attendant to show him the works. In this department, as in fact in all the other mills, everything moves like clock-work. About fifty men are employed here, and are divided into gangs, each set having its particular work to do. Here the timber is taken in, in the rough, as it comes from the forests, and after passing through the various manipulations, comes out finished kegs at the rate of six hundred and fifty per day, or faster than at the rate of one a minute for the entire working hours. All the timber from which the kegs are made is perfectly dried in kilns or drying-houses for that purpose, so that the kegs may be perfectly water-tight. Labor-saving machinery is introduced to facilitate such part of the work, and this cooper-shop is one of the most perfect we have ever seen.

When we consider that in many powder works the making of kegs and barrels, the refining of saltpetre and carbonizing of wood are done in separate establishments—but at these works all these are included—we must set them down as among the most complete, and we may justly feel proud that the young State of California can boast of them as taking rank with the most extensive powder works of the world, and we feel assured that the quality of their powder is fully parallel with the excellence and perfection of their establishment.

These mills are situated in a beautiful dell or valley, stretching along the river's bank; the different mills half protruding and half hid away among the numerous forest trees of pine, spruce, redwood, maple, alder, oak and sycamore, which have been left standing about upon the grounds,—forming at once a beautiful ornamentation, and serving the double purpose of a protection in case of explosion.

As one winds along the mountain ridge on either hand and catches a glimpse of the works below, the shimmering waters of the river, the mills standing here and there among the trees, the numerous tramways and footways connecting all the different storehouses and mills like a web,—it forms altogether one of the most picturesque and charming scenes our eyes ever beheld, and reminding one of the Swiss hamlet, as seen far down among the Alps, but wide-awake with the vim and stirring life of our American civilization.

Their success, we trust, will be commensurate with their enterprise.

THE SOUTHERN PACIFIC RAILROAD.—The Southern Pacific Railroad Co., through T. G. Phelps, ask the Supervisors of San Francisco to give the stock held by San Francisco in the San José Railroad on condition that they build thirty miles of road on or before July 1, 1869. A large number of tax payers signed a petition supporting the request.

The reservation of lands in this State for the Southern Pacific Railroad Company has been set aside by the Secretary of the Interior, on account of alleged failure to define the route, and the land has been thrown open to preemption.

ARTESIAN WELLS IN THE SOUTHERN COUNTIES.—A sensation has been caused on the Southern coast by the success of an artesian well ten miles south of Los Angeles, on the road to Wilmington. The water, which was struck at a depth of one hundred and two feet, fills a seven-inch pipe with a strong current, and rises four feet above the surface. This is the first artesian well south of Santa Barbara. A well enhances the value of land in that country very greatly, sometimes for miles around. Land speculators are wide awake to the importance of such developments.

A SCIENTIFIC CHURN.—J. N. Seeley & Co., 320 Sansome street, exhibit a churn which they have put to a practical test several times since the opening of the Fair. It makes butter in from two to four minutes from sweet milk, the modus operandi being both novel and interesting. The same firm have on the same stand a patent mop-wringer, and some revolving egg-cookers, both of which are different from anything of the kind we have been permitted to see.

WHAT is everybody doing at the same time? Growing older.

The Ætna and Phœnix.

The Ætna and Phœaix Firo Insurance Companies of Hartforl, Conn., are the acknowledged leaders in the business of fire underwriting in tbe United States, and havo gained their present popularity, wealth and influence through having conducted their business honorably, equitably and promptly Tho officers and managers of theso sterling institutions seem to thoroughly appreciato the fact that losses are legitimate in the business engaged in, and take as much genuine pleasure in paying an honest and squarely proven loss, as in receipting for a premium, and tbis fact seems to us to be one of tho leading secrets in the history of the unexampled success of these two great enterprises.

The "Ætna Fire" was chartered by the State of Connecticut as early as 1819, and since then has been in active service as an underwriter, keeping pace with time, and the improvements in and growth of this country; doing a general business, the company has had a hand in all of the great conflagrations that have been recorded in the history of the United States for *fifty years;* and while in some of these conflagrations their losses were severe, all have been paid promptly, and that without in any known instanco asking for a single days' grace for want of means to respond, though hundreds of local companies interested in these same conflagrations buve had to surrender to the fire fiend, and expired on their own battle-field. The Ætna has over five million dollars cash assets to endorse its contracts sustained by an income of over four million per annum, and has paid over twenty-three million dollars for losses since its first policy was issued.

The Phœnix Fire, organized under a perpetual charter by the State of Connecticut, has thus far proven hy its acts and success, its right to its "name" and a "perpetual lease of life." Year after year the company has moved along, making reputation and accumulating wealth and patronage, nntil it now ranks high in the list of model fire underwriters, surpassed hy none, and equaled only by the grand old Ætna. The Phœnix has a solid cash capital invested in the best and safest securities to be found in the Union, and its actual net casb surplus invested in the same way, by sbrewd financiers, amounts to *over one hundred per cent.* of its capital stock; or, in other words, that *for every one hundred thousand dollars of capital, it has over one hundred thousand dollars of surplus.*

The stock of the Ætna and Phœnix is of the "gilt edged" order, the par value he ing $100. It is bard to secure any number of shares in the Ætna at $201, or in the Phœnix at $198; the monied men of Connecticut, the farmers along the Connecticut River, and all well-to-do men within reach of Hartford, kcep an eye out for Ætna and Phœnix stock, and pick it up whenever offered, as a choice, sure and paying investment. Companies standing thus at home, where officers, securities and results are thoroughly known and appreciated, must stand well abroad. Hence the great popularity of the Ætna and Phœnix in each and every State, city, town and village in the Uniou, where they do a Fire Insurance business.

Nearly eleven years ago these progressivo companies located their agencies in San Francisco, for the purpose of granting protection to the *pioneers* on property then extra hazardous. Fires numerous and destructive occurred, year after year, in this State, and on this coast; these companies, as a matter of course, being interested to a greater or less extent, still paid as they lost, and instead of getting discouraged and hacking out, as numerous otber companies bave done, they stood hy our people, aud are now fixtures on tbis coast, real "Home Institutions," that are entitled to the patronage and support of a people they have stood by and protected, when "local companies" dared not organize.

Six years ago the "Phœnix" officers being satisfied that there were to he found outside of San Fraucisco, business meu, honorable, capable and trustworthy to represent them, estahlished a branch office in this city, and located fully commissioned agents at each prominent point, same as they have in the older States. The system worked well, and the "Phœnix," by placing confidence in Californians, secured the lead in business. The Ætna, becoming satisfied the "Phœnix" did not act prematurely in locating full ageucies, joined witb the company about two years ago, and under the control and supervisiou of R. H. Magill, the managiag agent, these companies are doing a large and a prosperous business. During the year endiug with July, 1868, they lost oaly $2,000 in this city, out of $279,000 paid by all companies, aad were not interested in the La Porte fire which called on the underwriters for $125,000! The ratos cbarged by the Ætna and Phœnix are *low*, very low when the quality of the security furnished is properly considered. The companies take small risks as compared with their immeuso assets, and should a large fire ever occur ia this city, then tho superior value of a policy in tbe Ætna or Phœnix will ho fully realized.

HUCKS' PATENT LAMP.—J. J. Hucks, who has several of his naphtha or benzine burners on exhibition in tho little enclosuro with the Business University telegraph office, has spent much tiaie and money in perfecting this lamp, or rather gas-hurner, which soems fully to answer the purposo intended—a cheap, strong light for use where ordinary gas cannot be had on reasonable terms, and where an exposure to currents of wind, as in tunnels and the open air, extinguisbes any ordinary lamp. The cheapness and cleaaliness of the material used, and the beautiful, steady light produced, should ere this have secured for it a more extended demand. By their use in mines, in had air and when the current is too strong for candles and ordinary lamps, its use would, we think, result in the saving of much time and health on tho part of workmen employed. Similar lamps are now and long have heen used ia England for such purpose, and even for ordinary use. We notice one of tbeso lamps is hurning every evening on the large engine of the Pacific Fonndry, in tho machine department of the Pavilion, which is a puzzle to visitors from the fact that its reservoir is placed sixteen feet distant, the fluid heing supplied through a small tube. It has a cluster of flames forming a more brilliant light than the surrounding burners, and many have taken it to be the product of a superior quality of gas.

Tbe lampis constructed on scientific principles. Its introduction to general use on this coast is a credit to tbe enterprise of Mr. Hucks.

AMERICAN TIME-PIECES—FIRST AND LAST. In 1800, Eli Terry, of Plymoutb Hollow, Conn., made wooden clocks in his kitchen. As soon as he had finished a couple of tbem, he would load up his old horse, and pack them round the country until he bad sold them. Then be would go home and make some more. In a few months be would he ready to sally forth on anotber trip. He did a good business.

In 1868, "The American Watch Company of Waltbam, Mass.", are turning out over two bundred and fifty per day of the finest watcbes in the world. Tbis is at the rate of one watcb in every two and a half minutes of working time. These are rushed hy rail and steamship to the uttermost ends of the earth. Tbey do a good business, too.

WALTER'S COOKING RANGE.—Thomas C. Walter, inventor, San Francisco, has on exhibition a model of an improved cooking range, wbich possesses many merits, although it is so small as to be overlooked by the general observer. This range is of such construction that either wood, coke, authracite or hituminous coal may be used, and the different compartments are so arranged tbat, hy a series of dampers, tbe fire, smoke and the vapors arising from the cookery, are so perfectly under control that none of the various articles that may bo cooking at the same time, will lose their distinguisbing flavors.

When the fire is new, the beat and smoke may he directed around one set of ovens, and after it has burned down to a clean fire, the top of the central compartment may he removed. A series of ovens are placed directly above this compartment, yet so perfectly are the flues and dampers arranged, that the flavor of the most delicate pastry is not injured by the roasting or boiling which may he progressing below. The range may be constructed of masonry, with an iron front, and the whole closed hy doors, so that the kitchen will be entirely free from the smell or heat of cooking.

WHAT do we often drop and never stop to pick up? A hint.

R. W. RAYMOND, of the New York Journal of Mining, lectured last week in Austin.

ADDITIONAL.—Amongst the new things brougbt in, of particular interest, are Larssen's Norwegian fishing boat, 17 feet long, 4 feet 7 inches hroad, and 1 foot 6 inches deep, being tho sizo in common use among the islands at the mouth of the Fiords, —very graceful and seaworthy, and tbe kind of boat that the Norse girls aro at bome in, and met in more frequently hy the traveler than men,—at tbe same quite suggestive of the ancient Norse ships of from 20 to 40 tons, with the lofty stem and stern posts frequently carved, which one may see to this day in the Sogne Fiord; Hinkle's patent bed bottom, made of slats suspended hy rubber, like Slocum & Kinzer's, only that the attachmont is slightly different; also an office bed with folding legs; Spaulding's Combination Watchmakers' Lathe, for turning small metallic objects; a peculiar pestle attachment to a stamp mill, whereby further pulverization and concentration are effected at the same time, ia successive mortars through which the pulp flows, etc.

A GREAT American exposition of arts is proposed for the year 1876, the centennial anniversary of the Declaration of Independence.

AGRICULTURAL FAIRS.—Tbe San Juaquin and the Sonoma County Fairs have heen in progress during the week.

A MOST INTERESTING FEATURE in the re-opening of Woodward's Gardens is the valuahle Library, comprising a choice selection of everything in the way of light literature, voyages, travels, history, biography, science, and art. *

FOOTE'S EYE SHARPENER can he bad at C. Muller's, 205 Montgomery street; hut the hest eye opener, after all, is a pair of his Brazilian Pebhle Spectacles. *

WHY ought a greedy man to wear a plaid waistcoat? To keep a check upon bis stomach.

PLANTATION BITTERS are especially recommended to clergymen, public speakers, and persons of literary habits and sedentary life, who require for digestion a relish for and clear mental faculties. Delicate females are certain to find in these Bitters what they have long looked for. *

WANTED—At this office, tho postoffice address of Enraght Massey, late of Ooid Hill, Nevada.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-a1m

SAVE YOUR TEETH.—Drs. Jessup & Seers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & SEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

1 T
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instantly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 652 Market street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
HOSE AND TAPE FUSE,
A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription to pay Wells, Fargo & Co's small on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

IRA P. RANKIN. A. P. BRAYTON. A. O. AUSTIN.
Pacific Iron Works.
First and Fremont Streets,
SAN FRANCISCO.
Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.
Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chattenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.
Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel-saving, first-class Engine, this is, without doubt, the best Engine made in the United States.
Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.
GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

Phœnix Iron Works.

JONATHAN KITTREDGE, Proprietor,

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents

EVERY MAN HIS OWN BARBER.—In Will & Finck's show-case, at the Pavilion, can be seen a novel idea in barber-ism—a hair-cutting shears, invented by Lee D. Craig, of Nevada county. This little invention will enable those who live at a distance from barber-shops to always have a fashionable cut to the hair, which can be done by any unprofessional hand with very little trouble. It consists of merely attaching to one blade of a pair of shears, a short comb, which is moved back and forth at right angles to the blade by means of a slide, and secured at any point by a set screw. The comb can be set at any distance from the shears, thus regulating the length of the hair. To cut the hair it is only necessary to run the comb up under the hair next to the scalp, commencing at the bottom, when the hair will fall between the blades, where it may be cut—lengthening the slide where it is desired to leave the hair long. Mr. Craig has applied for a patent for his shears through the MINING AND SCIENTIFIC PRESS Agency.

FINE ACCOMPLISHMENT.—The *Alta* appropriately notices the following:

Mr. James Lick, proprietor of the Lick House, has devoted years of study to the art of producing ornamental gildings ou glass, and those who examine his specimens on exhibition will not he slow to say that he has triumphed gloriously over all difficulties. The work shown is constructed of designs in gold, on glass, set in rosewood and laurel. A clock case, a dozen looking-glass frames and several picture frames, are gemmed with imitation arabesques, vines, bowers, architectural scrolls, and classical devices without number. The effect, even in the dim light under which this work is seen, is attractive and beautiful.

NITRO-GLYCERINE IN BELGIUM.—Of the recent explosion at Quenast, the *Independence Belge* says:

It would be difficult to give an idea of the desolated aspect of the place where the catastrophe occurred. The trees are without a single leaf, their branches and trunks torn or split; and the crops to a large extent are covered with the *debris* of stones, bricks, iron, and wood, which the force of the explosion carried to a great distance. The vast and solid structure by the side of which the explosion occurred was literally pulverized in the space of a second. There is not one whole brick left. Enormous beams have been hashed up, and others have been hurled to an incredible distance. The shop contained working materials and iron machines. Iron was also employed to a large extent in its construction. The whole of it was bent, twisted and sent flying over the country. We have seen an enormous bolt fixed several inches in the trunk of a poplar tree, at a distance of more than one hundred metres from the place of the accident; also, what was once a tie-beam twisted round the trunk of another poplar like a bracelet. The bodies of two sawyers who had been working at a distance from the shop, were found without any clothes. As to the eight persons who were engaged in discharging the nitro-glycerine, not a trace has been found of any one beyond a piece of flesh, a shred of clothes or a button. A fragment of a skull with long black hair attached to it, was picked up and recognized as that of M. Grillot. A five franc piece, bent and burut, was also found. The 1,800 kilogrammes of nitro-glycerine which exploded had an expansive force equivalent to 200,000 kilogrammes of powder, and was sufficient to blow up the entire city of Brussels.

THE CONTINENTAL RAILROAD.—The track is laid to a point 280 miles east of Sacramento, and before the end of September trains will be run to Winnemucca, forty miles beyond Humboldt City, 324 beyond Sacramento, and 448 from San Francisco. Ten thousand men are employed on the road, about eight thousand of them in actual construction, and the remainder in cutting ties, etc. During the first ten days of last month about twenty-seven miles of track were laid—an average of nearly three miles a day. All that prevents the laying of four or five miles daily is the impossibility of bringing up the material fast enough. A mile of track requires eight car-loads, forty-eight rails to a car, weighing in the aggregate nearly 110 tons; and 2,400 ties, with a large quantity of fish plates and spikes. The cost of the road where it is now being built is given at $50,000 per mile. The mountain section averaged a cost of $100,000 per mile. The total cost of the road to a point in the vicinity of Salt Lake will be a little under $65,000,000.

The Union Pacific Railroad Company are building hotels along their road at the principal points, for the accommodation of travelers, in the event of being delayed or desiring to rest while making the journey across the plains. Sherman, the highest point on the Union Pacific Railroad, is 8,262 feet above the level of the sea, and 7,292 feet above Omaha. At Laramie City they have a live paper called the *Frontier Index*, 14 by 16 inches, which is published in a house on wheels, and keeps at the terminus of the railroad.

GALVANIZING IRON.—Sheet iron, iron castings and other objects in iron, chains, nails, etc., are first cleansed in an acid bath, the water of which is so rendered by the addition of sulphuric and muriatic acids. Then they are put into an alkaline bath, the effect being produced by the addition of a little soda to the water. After this they are taken, one at a time, and scoured with sand, emery and water, using a piece of cork or cocoanut husk as a brush, and again thrown into a bath of very weak acid and water. Pure zinc when melted is covered at the time of the operation with a thick layer of muriate of ammonia (sal-ammoniac) in an iron boiler or open vessel. The iron goods to be galvanized are now to be dipped into the fluid zinc, slowly raising them from the metal, so that the superfluous zinc may drain off. They are then thrown into cold water, on removal from which they are wiped dry, and the operation finished. Thick, heavy pieces of iron require to be heated before dipping into the zinc, in order to avoid cooling it below the degree of fluidity.—*Septimus Piesse.*

WHY is a clock the most modest piece of furniture? Because it covers its face with its hands and runs down its works.

WHY is an alarm of fire in the night like a clothes-brush? Because it spoils the nap.

SAN FRANCISCO

HYGEIAN HOME WATER CURE.

No. 637 California street, opposite St. Mary's Cathedral.

WE HAVE NOW THE MOST EXTENSIVE AND COMplete Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest pursuance of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a Home combining all the Hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the prices for gentlemen to $50 per month; to ladies from $15 to $20 per week for board and treatment.

FARLOW J. SMITH, M. D.,
Physician and Surgeon.

H. O. COSGROVE, Superintendent. 21v16-3m

SAN FRANCISCO

Pioneer Screen Works,

JOHN W. QUICK, Manufacturer.

Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.

Screen Punching in all its branches, at rates reduced from 25 to 40 per cent. less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.

N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON.

Room 37, New Merchants' Exchange, California street, San Francisco. 17v15-tf

HAIR JEWELRY.—This is an example of one of those naturally growing up little specialties where individuals evincing a particular adaptation of talent and a little worldly shrewdness withal, are constantly finding new opsnings to their own profit, the advantage of their patrons, and not unfrequently to the wonder of slow people, who cannot see why they are favored with such extraordinary "luck." Mrs. C. Cook has an interesting exhibition of multitudinons neat little things made of hair and gold, a little beyond the fountain on the left hand side. It is generally acknowledged that in ornamental and tasteful design for little nonutilitarian articles, the French excel all other nationalities beyond comparison. Mrs. Cook manifests all of the taste of her Parisian fellow contributors to luxury. Looking over the variety of little conceptions in her show-case, we observed amongst other things a lilliputian knapsack, the body of which was made of brown hair, and the roll representing the overcoat on top, of blonde hair,—probably some memento of the war. There were, besides, little horseshoss, slippers, drums, safes, plows, books, harps, watering cans, etc., and full sized bracelets, and watch guards, of plaited and woven hair, plain and nnited with buckles and joinings of gold, short ones for gentlemen, and long ones, reaching around the neck, for ladies. No natural fiber can be found to make so rich, glossy and beautifully colored a texture as that from human hair, and silk itself cannot exceed it; not to mention, in this connection, the special and sacred values which are usually attached to the little mementos made of hair.

A NEW GOLD-SAVING MACHINE, in the form of a combined amalgamator and concentrator, on exhibition by Messrs. Hinkle & North, was inadvertently omitted in our report of this class of machinery. The amalgamator is intended to consist of two or more copper pans arranged in steps, the one above the other, across which the pulp flows,—a vibratory motion being at the same time given to the pans lengthwise. There are some 500 vibrations per minute,—the movement of each being only about three-eighths of an inch.

At the foot of each step is a reservoir for the quicksilver. Underneath the lower amalgamator is arranged the concentrator, with a similar vibratory motion, caused in each case by means of an eccentric and two upright wooden springs attached to the framework of the machine. The sulphurets when concentrated, are discharged into a box by the same automatic motion. It should be examined by all quartz miners.

PREMIUMS AT THE STATE FAIR.—We have received a catalogue of the premiums offered by the State Board of Agriculture for the approaching State Fair, which opens at Sacramento on the 15th, and is to continue until the 25th inst. Ten thousand dollars are subdivided so as to comprise a list of premiums occupying 24 pages of printed matter.

EIGHT-HOUR LAW STRIKE AMONOST MINERS.—An extensive strike in the coal regions of Pennsylvania has been caused by the eight-honr law passed at the last session of the Legislature. The miners demand that they shall receive the benefit of this enactment and at the same time obtain the wages heretofore given for ten hours' labor.

THE FLORENCE

RECEIVED THE HIGHEST PREMIUMS

At all the most important Fairs held in the United States in the year 1867. Gold Medals at the American Institute Fair, New York; Mechanics' Association Fair, Lowell; Maryland Institute Fair, Baltimore. Highest Premium at the New York State Fair, Buffalo, and at the Great New England Fair, Providence. At the Fairs held on the Pacific Coast, this machine has taken

Every First Premium

Awarded on Family Sewing Machines in the LAST FIVE YEARS. If there is a Florence Machine within one thousand miles of San Francisco, that is not giving entire satisfaction, if I am informed of it, it will be attended to without express charge or expense of any kind to the owner.

MILITAIRE.—This is the name given by J. D. Patrick to a modification of tenpins, which consists merely in a redaction of it to "five pins," and in a few simple combinations wherchy the services of a pin-setter, and ball-returner, are dispensed with. The alley is not level, hut rises very slightly toward the end where the pins arc; and heyond the pins there is a roof-shaped floor which canses the ball to roll either to the right hand or left hand into the gutter, along which it speedily finds its way hack to the hand of the bowler. To set up the pins there is an npright lever at the player's right hand, connected hy means of wire and strings with the head of each pin. A single motion of the hand raises them all up and sets them into their places at once; and the operation is itself an agreeahle exercise to the player. The head pin is called the "Captain," and counts four. The two on each side of the Captain connts two each, and the two extreme pins one each. Tho addition of the various comhinations of these numhers which may take place in the course of the game, affords a good mental, calenlation for juveniles. Mr. Patrick has succeeded thus in making ont, of time-honored howling a most excellent as well as economical school and family game.

CONSTABLE'S NEW METHOD OF GENERATING STEAM.—Fire generates steam—hut Mr. John L. Constable has invented an apparatns hy which steam itself is made to generate steam, and he claims for it the advantage of a material saving of fuel. The problem is a simple one, and can he tried at small cost. A jet of superheated steam is caused to meet a flow of hot water from the same boiler, in a side receiver. The result is that the water from the hoiler is instantly converted into steam likewise, at a very small expenditure of heat, and to any temperature desired, by merely regulating the proportions of steam and water with the stop-cocks on the respective pipes. The steam so generated is used like that from any ordinary hoiler direct. Where two boilers have heen nsed, on board of steamers, this invention, it is claimed, will afford the means of saving fifty per cent. both as to weight and space, and fifty per cent. of the fuel employed. The principle is the reverse of Watt's ancient, and still most commonly used, method of condensing steam to create a vacuum in the cylinders: instead of condensing the steam, the water is made to succumh, and to resign itself to its more immaterial condition. A snccessful invention of this kind mnst prove of incalculable valne to the man who proves its advantages, as well as to all those who are in the habit of using steam.

STUMBLING over some acquaintances last evening, they carried me around to divers and different stands where all the varions articles were exhibited to me, and I was permitted to "handle" them, a privilege not generally granted to visitors. I was especially interested in Palmer's patent leg; a better contrivance, it seems to me, to replace a lost limb, cannot he invented. I have often wondered how the things worked, and last evening succeeded in understanding it fully—there is a system of springs and wires which imitate the action of the natural muscles very closely. Jarvis Jewett is the agent, and to his kindness I am indebted for my present understanding—the very article, by the way, which he furnishes. As I do not stand in need of a leg myself, and Cherrylips could scarcely he persuaded to suhmit to an amputation of her natural members in order to he provided with artificial ones, I trust that no one will think I am hidding for a leg in this notice. B.

TROUBLES IN ALASKA.—Complaint is made by residents of our new province, in regard to alleged severities hy the agents of Hutchinson, Kohl & Co., to whom Prince Maxutoff turned over tho property of the Russian American Company on the 28th of April last. A newspaper war is going on, and the Alaska *Herald* of Aug. 15th comes with its fifth page bordered by a heavy black line, containing charges of tyranny, monopoly, ahuse, etc., in which the U. S. soldiers are alleged to he sustaining the oppressor.

THE INDIANS.—Massacres and outrages by the Indians in the Rocky Mountains continue to be reported. It will not be long now before they will learn, like their brethren of the East, so to respect the powers of the white man as to venture no further attempts to stay his ascendency, even in the heart of the Rocky Mountains.

We clip the following from the Sonora *Democrat* of a recent dato: "We have not seen a copy of tho PRESS in several weeks, and if it does not resumo its visits we will stop sending our paper to it." This we presnme is meant for us. We are pleased to inform the *Democrat* that our paper has hcen mailed regularly to its address, and we certainly regret it if it does not come to hand. The only reason we can assign is that the citizens of Tuolumne, in their thirst for knowledge, have waylaid and appropriated it. The only remedy we know of, Mr. Editor, is to urge your citizens to subscriho for the PRESS, and thus avoid the temptation. We would he sorry to have you put the latter part of your threat into execution, as we value your paper highly.

THE STATE UNIVERSITY.—The Board of Regents of the State University met at their office, on California street, on Wednesday. The propositiou to erect a temporary wooden building was carried, but it is to give way in due time to a more imposing one, that will be an ornament to the State. The salary of the President was fixed at $6,000 per annum in gold, and that of the Professor of Physics at $300 (gold) per month. A proposition to set aside $2,500, to he expended in ornamenting the University grounds, met with universal approval. A seal was decided upon of the size of an American silver dollar, appropriately designed, and having the name of the University, and the words "Let there be Light," engraved upon it.

ARRIVED IN TIME.—We noticed in the show-case of Mr. Lorquin, naturalist, a small hox containing specimens of precious stones, such as ruhies, sapphires, emeralds, etc., natural, cut and mounted, discovered and brought from Montana Territory by an old miner and California pioneer, Mr. Daney,—the discoverer of the gold and silver mine of the same name, in the State of Nevada. All these stones have been picked up hy himself in different claims of his own. Some of these specimens have been sent to Boston, London and Paris, and in the opinion of mineralogists and lapidaries, the sapphires and rubies are pure, and also that diamonds onght to be found in the same place. If speculators and amateurs would examino these stones, they may find in them a good investment.

VALLEJO AND SACRAMENTO RAILROAD.—Travel has commenced on this road, and there is a business done already of $2,000 a day. Five hundred tons of grain are daily transported over the road. The hour of departure from Sacramento is six A.M. The company confidently state that the cars will run to the Sacramento River, opposite the city, by the middle of November, and that the new suspension bridge will be completed by Christmas day.

TELEGRAPHIC INSTRUMENTS.—Crowds attend every evening upon Marwedel's display of telegraphic instruments to be delighted and instructed by his exhibition. It may seem visionary to assert that the time is at hand when a knowledge of telegraphy will be as necessary to a complete education as an acquaintance with writing, geography and grammar; but we believe it it is so, nevertheless. Communication by letter must to a considerable extent give place to the "word of mouth" between one city and another, as made practicahle hy electricity. A knowledge of the machinery by which this is accomplished, may be had through the exhibition of which we speak.

INSTITUTE MEDAL.—The committee for the award of the Institute Medal—jeweled and valued at $200, for such meritorious invention or industrial product as in the opinion of the judges will he of the greatest benefit to the people of California—has been appointed, and consists of Messrs. F. F. Low, R. B. Swain, Loring Pickering, James Pollock, and J. M. Eckfeldt.

MAGNETISM HARDENS IRON.—If a stay of soft iron be pressed against one of the poles of an artificial magnet the soft iron is observed to become hard, and it is more difficult to file. If the stay he removed it loses its hardness, and resumes all the properties of soft iron.—*Artisan.*

WHEN is a prison-door like an escaped thief? When it's holted.

WHAT is the key-note to good hreeding? B natural.

MANAGERS OF THE FAIR.—The list of Officers above enumerated constitute the Board of Managers of the Sixth Industrial Fair of 1868.

MUSIC.—By Willis' Celebrated Band.

New Mining Advertisements.

Bunker Hill Quartz Mining Company. Location of Works: Near Amador, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of May, 1868, an assessment (No. 8) of ten dollars ($10) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to DANIEL PALMER, No. 134 State street, Boston, Massachusetts.

And whereas said assessment was not duly advertised as required by law, and as contemplated by the resolution making the levy, at a subsequent meeting of the Board of Trustees, held September 2d, 1868, it was resolved, that—

Any stock upon which said assessment shall remain unpaid on the sixth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WALES C. PALMER, Secretary.

Office, No. 19 First street, San Francisco, California. sep5

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Alberding, F H	44, 45, 46, 47	79	$158 00
Bliss, D L	18	200	400 00
Blauvelt, W H	22	60	120 00
Grun, A K	48	203	412 00
Gray, T C	50	20	40 00
Gillig, Mntt & Co	not issued	100	200 00

Winters, John B	15	559	1,118 00
Young, A J	51	15	30 00

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of August, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the twenty-first day of September, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. sep5

North American Wood Preserving Company.

Location of Works: San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the third day of September, 1868, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Room 32 New Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. B. LAKE, Secretary.

Office, 32 New Merchants' Exchange. sep5

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volumo on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle, excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1vl San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE
—BY—
WM. P. BLAKE,
Corner First and Mission streets, or Box 2,077
3v13f SAN FRANCISCO.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to filt all orders with dispatch, and guarantee entire sutisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13-1y Stove Store, No. 125 Clay street, below Davis.

REMOVAL.

E. O. HUNT'S

Manufactory of
Wladmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to
114 and 116 Spear st.,
Next above Stuart and south of Missiou st., San Francisco.

Hunt'sPatent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt'sSubmerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constautly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be ahle to build everything in my line at greatly reduced rates.

All desirous of procuring water for lrrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

2tv16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S
Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They aro portable, can he used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 13 Geary street, where they are for sale by

M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flamo and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF
Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-Inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850
No. 3—Or 18-Inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

DENTISTRY.—The following from the *Alta* of this city is so *apropos*, that we give it entire:

In this department the samples are exquisitely beautiful, illustrating the highest order of mechanical skill and art. T. C. Jessup has a small case, with a massive framework of bronze, the interior face of which is furnished with a mirror, the whole inclosed in glass. The center contains a tree, the trunk of which is wrought with twisted silver wire, the numerous branches of the same material, from which are pendant nearly a hundred teeth (incisors, molars, etc.) each of which is filled and finished in a different style, and so finished as to present an idea of the difficult, delicate and perfect workmanship he is capable of performing in the dental profession. This branch of the bnsiness he has made his specialty, and the samples shown are convincing proof that his attainments in this branch of mechanical skill are of no mean order. In a separate department of the Pavilion Dr. Jessup displays a case of the beautiful instruments with which his splendid work is performed.

Jessup & Beers (the same Jessup) exhibit also a case of plate-work, in gold, silver, platina and vulcanite, worthy of examination.

WHAT word is that in the English, the first two letters of which signify a man—the three first a woman—the four first a great man—and the whole a great woman? Heroine.

WHY is a selfish friend like the letter P? Because, though he is the first in pity, he is the last in help.

WHY is a Hebrew in perfect health like a diamond? Because he's a Jew well.

Universities of Business.

The fact has been fully demonstrated that *business* is a science which may bo tanght like other sciences. Ignorance is no more successful in commerce than in law or medicine. Let us, then, says every thinking man, havo schools and universities of business, as well as of law and of medicine. We believo that a branch in which tho great mass of our people are so intimately interested should not be neglected, and it therefore gives us pleasure to chronicle the marked success of the CALIFORNIA BUSINESS UNIVERSITY in our midst. This institution makes a fine display at our Fair. In the small art gallery, near the entrance to the Pavilion, are to be seen specimens of penmanship, pen-drawing, the diploma of tho University, etc. The business penmanship, evidently the specialty of tho University, is the best we have seen on this coast.

The telegraphic department of the Business University is situated at the right of the main entrance to the uppor art gallery, and attracts a great deal of attention from those anxions to learn the working of the telegraph. There are on exhibition two sets of instruments, illustrating the methods of receiving dispatches by both sound and paper. Theso instruments are connected by a line with the University, at the corner of Bush and Montgomery streets, and dispatches are being almost constantly sent back and fonrth by the students, who are pleased to explain the *modus operandi* to any one inquiring.

The visitors of the Fair who have never had an opportunity of visiting the University, can thus form a good idea of the virtue of this institution, and its mission in fitting young men for actual business. Its graduates are said to he competent to enter at once upon the duties of book-keepers, since they receive daily drill in all the dnties pertaining to an accountant's position, which are fully illustrated by *actual* practice. This system is greatly superior to the old theoretical method, and we are glad to see this school receiving the cordial support of our leading business men. It distictly shows that they do not regard business as mere luck or chance, but something to be learned by patient study and careful practice.

The University is under the charge of E. P. Heald, the first to introduce this actual business system upon the coast. It is now located at 204 Montgomery street, in the rooms recently occupied by the Mercantile Library, and is well worth a visit from all interested in edncational affairs.

WHAT is the difference betwecn the Hebrew idea of a slave and the modern notice of a wash-stand? The former is stated to be "a hewer of wood and drawer of water," while the latter is "a drawer of wood and ewer of water."

WE noticed by the card of Dr. L. Adams, for black, blue and red inks, that they are manufactured on a large scale, being for sale by the bottle or barrel—a great saving of expense to interior traders. The saving of freight on the glass must reduce the cost materially.

WHEN has a man four hands? When he doubles his fists.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

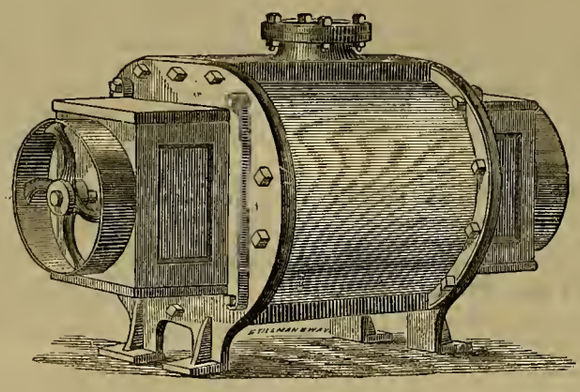
THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

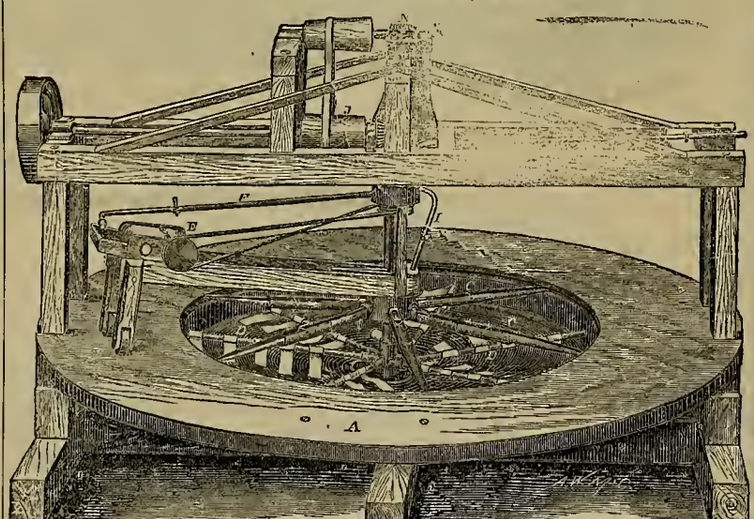


J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16-6m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



Awarded the First Premium at the Paris Exposition.

PAINE & STEPHENS'

IMPROVED CONCENTRATOR.

For Saving Gold and Silver Sulphrets.

This invention, a perspectivo view of which is given abovo, consists in applying machinery to the ordinary buddle, and rendering the same automatic in netion It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can bo easily run by one man turning a crank. Tho principlo on which it works is entirely dissimilar from any other machine now used on tho Pacific Coast; although it is in almost universa use in Europe; but not so arranged thero as to be automatic in netion.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of theso machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps, Another machine may be seen at tho Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FISER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivalling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

$100 A MONTH SALARY WILL BE PAID FOR Agents, male or female, in a new, pleasant, permanent business. Full particulars FREE by return mail, of sample, retailing at $4 60, for 50 cents. A. D. BOWMAN & CO, No. 4 Broad street, New York.

MINING PRESS.—This old standard mining journal of the Pacific Coast, comes to us this week, number 1 of Volume XVII, and much improved in several particulars. A beautiful new head and heading letters throughout, make it the neatest, as it has always been the best, exponent of the industries of this coast. Every miner should take the PRESS. The subscription price is $5 per year, and the Postmaster at Monitor is an authorized agent.—*Alpine Miner July 4th.*

A New Balanced Oscillating Engine.

Tbonsands of visitors at the Fair have paused to admire tbe beautiful and exquisitely finisbed engine which runs in connection witb our DAILY FAIR PRESS, supplying tbe power for the same. So small and compact is tbis engine tbat one could seemingly take it in the band, or pack it in a valise and walk off with it at ease, and yet it is rated as a 9-horse power machine. It is probably the finest finished piece of operative mecbanism in the whole exhibition.

Messrs. Detrick & Eckart are the inventors and builders, both of wbom are young men, connected with H. J. Booth & Co's Uuion Foundry, of tbis city—Mr. Detrick being foreman of the finishing department, and Mr. Eckart draughtsman and civil engineer. Both are deserving of much credit for their skill and perseverance in bringing out so bandsomely constructed an engine, and so promising an invention. By special request we have been furnished tbe following description of its principles and operations:

This is tbe first practical solution of the mechanical problem of working two pistons in an oscillating cylinder. Tbe many advantages to be derived from this style of engine makes it very desirable; for great speed, small space and large effective power are obtained by this metbod. The cylinder is perfectly balanced, and has no friction on the trunnions, except wbat is due to tbe weigbt of the cylinder, all otber frictional points are neutralized by the combination of two pistons, and being balanced, any speed may be used to suit condition of work, or fancy of owner. As a propeller engine, it supplies a much needed want, namely, an engine to take up small space in the center of boat below water line, that will permit the propeller shaft to be placed yet below it and all parts be accessible, combined with good speed and few working parts. This engine has no slides and but two strap joints, with the requisite number of bearings for the two crank shafts and propeller shaft. The advantages of this engine over other oscillators are due to tbe peculiar manner in which the pressure is received and delivered from tbe pistons. The pistons being so connected as to move to and from the center of oscillation simultaneously, under the same pressure and velocity, all strain and friction due to action of the steam (or motive power) is removed from the trunnions. As eacb piston separately travels througb but one half the stroke, the oscillation of the cylinder is but one-balf that of tbe ordinary oscillating engine. In tbe ordinary construction of oscillating engines, the movement of the cylinder is produced by the piston rod, and in consequence tbe rod bas to be made much longer in diameter, and the stuffing boxes and glands mucb deeper and stronger, and in many cases guides have had to be substituted to overcome the great friction produced by the action of steam on tbe trunnions, which in this engine is entirely obviated. As before stated, there being no strain on the trunnions, there can be no tendency to move the bed-plate, and the engine can be run up to any number of revolutions without producing auy vibration on its supporting mechanism, which, for hoisting, propeller and portable engines, is very desirable.

Under the speed of piston at which the one now at the Fair can be seen traveling, the horse-power, with 60 pounds of steam is nine, and the total weight of engine and bed-plate complete, is less than 200 pounds.

These engines can be built either with gears, as the present one, or with crank shaft. The gears offer the facility of gearing up the shaft to any required speed, either faster or slower than the engine. The shafts will allow the engine to be placed nearer the kelson of the vessel.

QUARTZ veins containing considerable gold, have been discovered in a spur of the Blue Ridge, near Frederick, Md., says the Frederick *Union*.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, SEPTEMBER 12, 1868. VOLUME XVII. Number 11.

Rudolph's Patent Gun-Lock.

The improvement in gun-locks, herewith illustrated, was patented in the United States April 17th, 1866, by Wm. Rudolph. The first figure represents a side sectional view, showing the main-spring, tumbler, etc., all of which are contained in the opening, just the thickness of the main lock plate. The second figure shows the outer plate, and the third and fourth figures the inside plate. These onter and inner plates form a perfect covering of the operative portion of the lock, strengthening it and protecting it from the effects of powder, dirt, dampness, otc.; rendering cleaning seldom necessary.

RUDOLPH'S PATENT GUN-LOCK.

By inserting the operative portion of the lock in the opening within the main plate, the lock as a whole is made thinner and lighter than the ordinary lock, as shown in the edge view in the figure on the left of the engraving. It strengthens instead of weakening the gun-stock, as in case of the old style lock.

Many of these locks are in use in this State, giving good satisfaction, and the fact that the lock has proved a success adds interest to its illustration in our columns.

Mr. Rudolph has also secured through our agency patents for Great Britain, Belgium, Russia, Prussia, and France, in which countries locks are now being manufactured.

The patentee has now briskly in operation, at 216 Pacific street, the first gun factory worked by steam on the Pacific Coast. He employs superior workmen, and the most complete set of tools of any shop in the State. Nothing but guns are made at this shop, and those for close shooting are made a specialty with Mr. Rudolph. We believe the invention to be one which will meet with general application, and a credit to California ingenuity. Mr. R. makes a creditable display of guns, pistols, and gunsmiths' work at the Pavilion, near the Golden Gate Pottery stand.

REFINING SUGAR BY ELECTRICITY.—It has been found by experiments that a stream of electricity derived from a powerful electro-magnetic machine driven through a solution of brown unrefined sugar will bleach it, electricity being thus made to perform the function of charcoal. It appears that one of Wilde's electro-magnetic machines, driven by a 15-horse power engine, has been set up for this object in a sugar refinery in Whitechapel.

MACHINE FOR MINING UNDER WATER.—W. T. Duval, of Georgetown, D. C., has just patented an apparatus applicable to the recovery of gold or other metallic deposits found in the beds of streams, and the removal of sand-bars or other similar obstructions to navigation. It is based upon the application of the principle of exhaustion to produce rapid currents of air or water. For working in water a vessel of suitable construction is provided with a steam engine and rotary or centrifugal pump, to which the suction-pipe is so applied as to be capable of extension to any desired length, and susceptible of reciprocating vertically, oscillating, or of rotary motion, so that while the pump is at work and producing a current at great velocity, the suction-pipe, being provided with a suitable appliance at its lower end, may be used to dig, bore, or otherwise loosen the deposit, which is immediately drawn up and discharged by the pump into a separating apparatus, upon the principle of that patented by the same inventor on Oct. 15th, 1867.

FIRE CLAY.—A good article of clay has been found at Michigan Bar, Sacramento County, where a pottery has been established, and fire-brick has been turned out equal to the best English imported, having been used in Coney & Bigelow's furnaces.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

CATALOGUE OF THE SIXTH INDUSTRIAL EXHIBITION OF THE MECHANICS' INSTITUTE.

The following catalogue embraces the entries receipted for by the Clerks of the Board of Managers, arranged in classes and subdivisions, with the names of the Judges of Awards. The list is copied from the books of the Board, and as it is more than likely that errors and omissions have occurred, it is presumed the publication of the catalogue in this form will assist in obtaining a correct list for the final report of the Fair. Parties who may discover any inaccuracies are requested to report the same at the office of the Board of Managers.

INSTITUTE MEDAL.—Judges to award gold medal to that invention, industry, product or manufacture judged to be of greatest benefit and value to California: F. F. Low, R. B. Swain, L. Pickering, James Pollack, J. M. Eckfeldt.

Class 1.

SECTION 1. Steam Engines, comprising Stationary, Marine and Fire, Locomotives; also, Boilers, and Improvements thereon. Judges: Wm. Burnett, Mont. Fletcher, J. Swyney.

22. S. C. Higgins, horizontal steam engine, made by an apprentice.
48. Robert Blair, horizontal steam engine, made by an apprentice.
104. J. L. Constable, new mode of generating steam.
112. Swyney & Smith, drawing of an improved horizontal engine.
211. C. H. Foster, model of California invented steam engine.
269. J. M. Greiss, model of California invented walking-beam engine.
57. Levy & Haley, patent fire extinguisher.
109. Risdon Boiler and Locomotive Works, California made steel boiler.
144. Ætna Iron Works, 2 sets Bemis' grate bars, California invention.
145. Robert L. Harris, two sets Carvalho's steam superheaters.
184. Howland, Angell & Co., two Hicks engines and boilers
199. Detrick & Eckart, California invented oscillating engine.
—— H. B. Martin & Co., California invented oscillating engine.
292. R. Wells, equilibrium steam engine.
263. Henry Tripp, model of locomotive, in working order.
393. McAlfico, Spiers & Co., Christoffel & Booth's Patent Elliptic Boiler Scraper.
—— H. J. Booth & Co., Scott & Eckart's self-regulator and cut-off engine.
—— Goddard & Co., Pacific Iron Works, Wright's patent variable cut-off engine.

SECTION 2. Motive Powers, comprising Air Engines, Eclectic Engines and all Motive Powers, Turbines, Water Wheels, Windmills, etc. Judges: Joseph Mooro, Geo. K. Gluyas, Wm. McKibben.

285. Attwood & Bodwell, California invented windmill.
183. E. O. Hunt, windmill model.
365. W. J. Tustin, windmill.

Class 2.

SECTION 1. Machinery for Working Metals. Judges: H. P. Brunner, E. T. Steen, D. B. Hluckley.

81. Fornbnis, hydraulic blower.
114. Goff & Bishop, California invented crank-pin and crosshead lathe.
189. Marsh, Pillsbury & Co., fan blower.
353. N. Lumsden, California invented apparatus for making screwed boots and shoes.
354. Attwood & Bodwell, model of self-lubricating journal.
2. Peterson & Jones, patent spring hammer, California invention.
64. Wm. Rudolph, patent turning-lathe.
136. J. Dougberty, self-regulating thread-cutting machine.
164. C. F. Robinson, Rose's patent tire upsetter.
197. J. S. Detrick, eccentric chuck.
200. Kittredge & Leavitt, one punch and two pairs shears.
170. Hughes, Kimball & Co., one tire upsetter.
340. Andrew Spaulding, watchmaker's lathe.
13. D. E. E. Winchell, Roger's portable forge.
5. A. S. Hallidie, machine for making wire rope, California invention.
—— Nelson & Doble, drilling machine.

SECTION 2. Machines for Working Woods. Judges: D. A. Macdonald, Wm. N. Miller, C. W. Thomas.

137. F. A. Huntington, shingle machine.
190. I. H. Small, planing machine.
209. J. W. Alesworth, machine for beveling barrel staves
384. James Hatch, guards and guides for molding, California invention.
157. Jas. Hatch, improved mortising chisel, California invention and patent.

SECTION 3. Agricultural Machinery. Judges: W. C. Bartlett, Rev. Horatio Stebbins, C., L. Low, R. B. Woodward, Samuel Dinsmore.

262. Coffin & Standish, California invention steam plow.
280. J. Marquis, model of steam plow.
6. J. & J. Ingham, San José, gang plow.
51. F. V. Lamb, vegetable root cutter.
141. M. C. Hawley & Co., agricultural implements.
142. Hawley & Co., three clipper mowers.
171. A. Hunter, grain separator, California invention.
176. Ed. Kimball, gang plow.
182. D. Winter & Co., combined seed-sower and cultivator.
185. Baker & Hamilton, sweepstakes gang plow, etc.
212. W. H. Weister, Randall's patent sulky rake.
212. Baker & Hamilton, combined Shaker reaper and mower.
265. Dexter & Lambert, California made cultivator.
305. A. Hunter, rake, hay and grain-loading machine.

SECTION 4. Miscellaneous and Manufacturing Machinery, etc. Judges: J. Spiers, Robt. Carlisle, N. W. Spaulding

65. Pacific Woolen Mills, machine for knitting socks, drawers, shirts, etc.
233. Wm. Lyne, machine for picking hair.
—— Spaulding & Co., carpet-beating machine.

15. Robert Hewston, self-generating gas machine.
47. Pioneer Woolen Factory, fancy loom.
134. Geo. E. Butler, family knitting machine.
178. J. Newman, silk loom.

Class 3.

SECTION 1. Machinery for Mining, Tunnelling, Metallurgical Processes; Crushers, Stamps, Grinders, Pulverizers, Amalgamators, Conveyances; Furnaces for Roasting; Hoists, etc. Judges: Jos. Moore, M. Attwood, R. Watt.

19. Mrs. E. J. Hall, drawing of patent smelting furnace.
108. A. Herdlein, model of improved stamp mill.
199. G. H. Leland, model of improved quartz battery and screen.
12. Vulcan Iron Works, Moore's patent hoist.
300. J. W. McKenzie, patent self-adjusting truck for flagstaffs.
83. J. B. Johnson, patent California invented friction hoist.
131. J. Hendy, two improved concentrators.
135. A. M. Burns, Slusser's self-loading excavator.
150. Miners' Foundry, Howland, Angell & Co., McAuley's rope hose covering.
189. W. H. Hepburn, California invented amalgamators.
193. Hinkle & Capp, grinder and amalgamator.
201. J. C. Kernan, concentrator.
335. Varney & Rix, rock crusher.
373. Dewey & Co., for John A. Collins, model of amalgamator.
375. Thos. Varney, amalgamator, with improvements.
385. John A. Collins, oscillating quartz crusher.
20. V. Smith, new principle quartz mill.
—— M. Hungerford, concentrators.

—

SECTION 2. Pumps, Hose Pipes, Nozzles, Couplings, Apparatus for burning Petroleum, as Steam, Fuel, etc. Judges: D. E. Hayes, Chas. Elliott, Geo. Fogg.

26. W. Cushing & Co., Excelsior double acting force-pump.
45. G. Munson, California submerged pump.
78. G. M. Gerrish, submerged pump.
180. L. D. Craig, globe hydraulic nozzle and coupling, California invention.
183. E. O. Hunt, three California patent pumps.
280. Vulcan Iron Works, centrifugal pump.
292. H. B. Martin & Co., force pump, California invention.
297. M. D. Lasswell, artesian pumps, submerged pumps, windmill pumps, stock pumps, brass force pumps, Golden State double-acting force pump—all California invention and make.
310. A. J. Smith, Hudson pump.
361. W. D. Hooker, steam pump, California invention.
383. Ætna Iron Works, patent steam pump, Dunbar's self-adjusting steam piston packing, iron furnace in operation.
41. David Stoddart, Cameron's steam pumps, governors and injectors.
—— Pacific Pump Manufacturing Co., American submerged pump.

Class 4.

Models of Vessels, etc., Tackles, Rigging and General Improvements, including Hemp and Metallic Cordage. Judges: J. M. Selden, A. T. Fletcher, A. M. Westervelt.

4. Tubbs & Co., California made rope.
8. A. E. Larssen, models of vessels.
14. T. F. Mitchell, California made blocks and sheaves.
45. H. A. Jacobsin, model of vessel.
64. Geo. Howes & Co., model of "Young America."
96. W. T. Herrick, model propeller.
111. J. Shunhoff, model steamboat (tin).
116. A. Wingard, model patent steamboat wheel.
117. T. B. Roche, patent swivel shackle, California invention.
250. F. Desbarbieux, plaster model of propeller.
252. J Franklin, model of ship.
265. W. M. Ryan, model of vessel, and carved walnuts teeth.
270. E. C. Rowe, ivory model schooner.
333. Mrs. A. Rodgers, model of steamship "Zoe."
375. L. T. Lewis, model of merchantman.
30. Gustavus Jessen, model of "Shubrick."
12. E. T. Barlow, patent anchor and chain.
207. N. B. Adams, two combination boat-detaching blocks.
244. Wm. Rumwell, model of ship.
254. J. C. Cousins, two models of boats.
273. John Daly, model of schooner.
360. R. L. Ogden, model of yacht.
41. S. Marion, model of ship.
24. Capt. Wylie, steamship and model of ship.
38. J. E. Thayer, four models of ships.

Class 5.

Military Engineering, Armor, Accoutrements, Ordnance, Small Arms, Tents and Camp Equipage, Gunpowder and other explosives, Matches and Fireworks. Judges: S. R. Ellis, H. F. Pippy, J. J. Haley.

33. Church & Clark, California made fireworks.
132. Wm. Rudolph, 1 case arms, etc., California make and invention.
137. Pacific Powder Mills, California made powder.
148. Snyder & Browning, case gun material.
290. San Francisco Percussion Match Company, California made matches.
113. Wm. H. Jessup & Co., California made matches.
225. California Powder Works, California made powder.
262. Pioneer Fuse Company, California made fuse.
368. Giant Powder Company, samples Giant powder.

Class 6.

Civil Engineering and Architecture, and other building contrivances; Sanitary and other improvements; Architectural, and Railroad, and Bridge Drawings. Judges: Geo. Gordon, H. C. Macy, Col. Bulkley.

37. Swyney & Smith, drawing of Hallidie's patent wire suspension bridge.
359. H. Lombard, patent chimney top.
369. W. H. Harvie, patent hop kiln.
60. Wm. McKibben, metal sewer bell or valve.
251. Wm. O. Murtha, patent chimney top.
175. F. J. Davenport, redwood railroad tie and post.
187. A. C. Taylor, kitchen sink and hopper, etc.
303. Dr. Beers, improved railroad ear.
333. Chas. Darber, section of foundation of railroad bridge post.
336. J. W. Pearce, model of inclined track for mines.
34. H. Hale, W. L. Washburn's patent self regulating railroad car ventilator.

Class 7.

SECTION 1. Philosophical and other Instruments and Processes in which they are used, Mathematical Instruments and Balances, Nautical and Engineering Instruments. Judges: Sherman Day, Wm. Schmolz, Herman Shussler, E. H. Dyer.

197. T. Houseworth & Co., optical goods.
330. J. Roach, mathematical instruments.
41. Fire Alarm Tel. Co., telegraph instrument.
42. Lundberg & Marwedel, fire-alarm and telegraph instruments.
222. Cal. Business University, telegraph apparatus.
246. Pacific Business College, telegraph apparatus.
68. Fairbanks & Hutchinson, scales and money drawer.
86. E. H. Pratt, adjustable scale column, attached to Fairbank scale.

—

SECTION 2. Surgical and Dental Instruments, and Dentistry in all its Branches. Judges: Dr. James Blake, Dr. H. Austin, Dr. C. C. Knowles.

74. G. W. Cool, dental goods.
89. D. S. Hutchinson, dental goods.
90. H. W. Calvert, dental goods.
142. Drs. Cogswell & Woodward, dental goods.
198. J. Jewett, Palmer's patent leg.
19. Dr. A. Folleau, orthopedical instruments.
80. M. M. Cook & Son, artificial legs, California made.
95. E. O. Belle, apparatus for extracting teeth, and case of dentistry.
99. A. W. Calder, dental goods.
302. Dr. J. C. Jessup, dental goods.

Class 8.

SECTION 1. Plain and Ornamental Castings, Stoves, Safes, and Wrought Iron Work; Shutters and General Blacksmithing Work. Judges: I. M. Scott, Chas. Steiger, J. R. Sluis, J. G. Ils, H. S. Smith.

124. M. Grogan, sample California made horse shoes.
283. Misgill & Cooper, sample California made horse shoes.
309. Betts & Fookes, buggy springs, California made.
71. Pacific Rolling Mills, California forging samples.
68. D. Jones, three sets axle-trees, California patent.
257. Pacific Rolling Mills, samples California forging.
372. Vulcan Iron Works, perforated grate bars, friction pawl, etc.
306. W. S. Kellum, spiral buggy springs.
281. W. N. Hendry, first piece casting ever made in California.
274. Taw, Brooks & Backus, cooking stoves, etc.
286. John Bohn, stoves, etc.
235. L. Cheills, two house safes, California made.
200. Kittredge & Leavitt, monitor safe, California made.
187. A. C. Taylor, stoves, sink and portable range, California manufacture.
156. Holbrook, Merrill & Co., stoves, etc.
315. M. B. Bullard, petroleum stoves.
339. T. C. Walter, model of range.
348. J. B. Owens, stoves, coal oil, lamps, etc.
118. ——Cronk's self condensing steam cooking apparatus.
§ 307. Jonathan Kittredge, two Monitor safes.

—

SECTION 2. Tools, Saws, Hardware, Cutlery, etc.; Locks, Keys, and other Fastenings and Wire Goods. Judges: J. Hewston, Jr., A. A. Louderback, Walter N. Hawley, J. McGill, John Dickson.

27. B. L. Stone, patent burglar alarm.
13. F. Schoener, spun metal, California made.
83. D. F. Barrows, patent window springs, Jenks' patent.
133. C. Otto & Co., machinists' tools.
183. O. P. Oakley, door plates, bell hangings, etc.
188. M. Price, California made cutlery.
208. Boone & Lumsden, samples sail needles, California invention.
214. N. Hoffman, California made flower stands.
220. S. M. Briggs, Californ'a invention, mitre box.
256. Carl Hein, California made earing tools.
287. Pacific File Works, California made files.
340. V. T. Wilbert, patent safety hook.
346. W. C. Bussey, improved combination safety lock.
—— Isham Key, register locks.
3. H. T Graves, samples of wire goods and weather strips.
21. J. A. Hoffman, shutter holder.
28. H. J Booth & Co., quartz, slot and grain screens.
46. Will & Finck, cutlery and surgical instruments.
49. V. S. W. Parkhurst, combination locks and patent money drawer.
52. W. A. Sublett, improvement on window supporter.
92. R. L. Stone, 1 traveler's burglar alarm
39. Wm. Heney, combination brace or boring machine.
126. Pacific Saw Manufacturing Co., California made saws, etc.
121. Pacific Saw Manufacturing Co., Soper's hay knife.
122. A. M. Seaburg, patent wood saw and stretcher.
125. Robert Hewson, patent friction roller parlor skates.
128. Will & Finck, bell hanging, California manufacture.
139. S. F. Screen Works, improved quartz screens.
158. Miller's Adjustable Saw Tooth Co., California invented teeth for circular saw.
174. Nelson & Doble, blacksmith, miners, and stone cutter's tools.
192. Ball Bros., U. S. patent vices.
195. N. W. Spaulding, circular saws, inserted teeth, California invention.
198. Wm. Kewan, center radiating and adjustable square.
220. Pacific File Works, reaper sections, etc.
223. Frank Able, Gridley's patent weather strips.
226. J. Weichart, edge tools.
165. J. Gray, broom wire, California manufacture.
275. R. Riley, adjustable tongs, California invention.
317. Barker Spring and Butt Co., concealed door spring and reversible joint butt.
320. Alfred Swinkle, one gear drill.
345. E. Dougeon, Dudgeon's improved hydraulic jacks.
9. American Saw Co., sixteen saws.
319. Chas. Watson, set of tools for cutting threads.
29. P. Quigley, California-made carpenters' tools.
31. American Saw Co., Emerson's patent saw teeth.
—— J. H. Culver, improved caliper, California patent and manufacture.
180. L. D. Craig, combination hair-cutting shears.

—

SECTION 3. Castings of Tin, Lead, Brass, and other Metals and Compositions and Brass Finishing. Judges: J. M. Eckfeldt, J. W. Brittan, W. W. Montague.

233. R. F. Ashburn, patent self-oiling cups.
335. W. T. Garratt, bells, cannon, and brass goods, California made.
304. Garvey & Kimball, California made gongs, etc.
42. Garvey & Kimball, California made bells.
62. Gallagher & Weed, brass goods, California made.
146. C. E. Blake, safety valve for fire hose.
278. C. Allison, hose couplings, California invention.
364. P. Caduc, water cock, California invention.

—

SECTION 4. Copper Stills, Worms, Pipes and General Work, Lead Pipe, Sheet Lead and Shot, Plumbing, Gas-Fitting and Tinware. Judges: Melville Attwood, C. W. Smith, W. S. Snooks.

3. Dr. C. Farno, self-lighting gas-burner.
101. W. A. White, patent sad-iron holders.
212. Milliken & Johnson, California invention, self-soldering cock for tin cans, etc.
277. J. Sims, patent gas chandelier globe reflector.
296 R. B. Thomas, California patent submerged coffee boiler.
392. H. Wessels, revolving joint pipe.
150. W. Walmsley, artesian well pipes.
167. C. Newman, patent lamp burner and glass-melting pot.
183. John J. Hucks, portable gas lamps.
208. G. Reuben, patent sauce-pan covers.
217. T. H. Selby & Co., lead pipe, shot, etc., California made.
288. J. R. Whittemore, samples of Shocner's patent nochimney kerosene lamp burner, with J. B. Owens' goods.
329. Thos Ross, weather vane.
342. F. Rohrer, lamp extinguisher.

Class 9.

Glass, Pottery, Clayware, Glass-Blowing, Cutting and Coloring, Fire-Brick and Fire-Proof Ware, Brick, Tiles and Cement. Judges: Leon. M. Kellogg, James Harris, R. H. McDonald, N. P. Langland, Isaac E. Davis.

343. Menant's Asphaltum Co., new lot of asphaltum.
347. Benicia Cement Co., Benicia cement.
11. R. A. Swain & Co., China ware and fancy goods.
14. San Francisco Glass Works, California-made glass.
82. Pacific Glass Works, California-made glass.
107. Golden State Pottery, California-made pottery.
196. Pacific Concrete Co., side-walks, drain pipes.
290. Skinner & Flick, Excelsior sanitary pipe, California made.
332. Knapp & Grant, Roman cement.
10. Haynes & Lawton, glassware.
11. R. Mills, stained glass.
324. Noble & Gallagher, embossed glass.
103. Thomas O'Neil, ornamental cut and ground glass.
76. John Mallon, ornamental cut, ground and stained glass.
130. Robert Mills, embossed work on glass.

Class 10.

SECTION 1. Native and Foreign Wood, Sawed Timber or Lumber, and Its uses; Carpenters' (House) and Joiners' Work, Scrolling, Turning, Moulding, and Carving. Judges: James Easton, B. H. Freeman, N. P. Langland.

51. Blythe & Wetherbee, 1 stick Puget Sound timber (outside pavilion).
226. I. E. Thayer, California laurel wood.
231. J. Perkins, veneer and wall hangings.
282. A. Cameron, wood and ivory fruit basket.
281. C. Wulbrun, wooden puzzles.
136. Sheppard & Carroll, California made lasts.
368. I. E. Thayer, 1 stick California laurel (outside pavilion).
336. J. O. North, 1 stern-knee (outside pavilion).
1. H. E. Perry, model of wooden pavement, California invention.
38. J. W. Linsley, hat and wig blocks.
96. P. Gibot, spiral staircase, model.
224. A. E. H. Sturcken, improved window frames.
228. C. Romer, California polished wood.
168. P. H. Fluck, anatomical last.
315. Spurgeon & Rowland, California sugar pine planks.
341. James Behrens, tesselated pavement.
133. Bryant & Strahan, carved sideboard.
—— J. D. Boyd, native woods.

—

SECTION 2. Casks, Barrels, Kegs, Tubs, Pails, etc.; Brushes, and Willow and Wooden-ware. Judges: P. M. Bowen, T. F. Neagle, Alex. Murdock.

55. Figer Bros., California made brushes.
129. Miss A. W. McClelland, Peterson's patent washing machine.
131. Feldmann, Simpson & Co., California made brushes.
141. G. A. Jones, washing machine.
144. M. Zan & Co., California made brooms.
183. Elam & Howes, California made wooden-ware.
236. Mr. Coleman, patent atmospheric churn.
342. G. E. Wenzell, California cask and oak.
5. C. W. Weston, cider presses.
12. Thurnauer & Zinn, willow and wooden-ware.
19. Morrison & Holland, Dixie washing machine.
22. J. Vail, 1 washing machine
51. F. B. Lamb, Pioneer washing machine.
63. Pacific Barrel and Keg Company, California made barrels and kegs.
114. P. Rasmunson, California washing machine.
140. California Wine Cooperage Company, California made wine casks.
249. J. S. Hittell, Poor Woman's Washing Machine.
213. Florent Eck, 2 tubs, 2 wooden pitchers.
267. H. Lundie, Wolverine washing machine.
377. J. N. Seeley, churn, wringer, etc.
28. Mrs. A. D. Waldron, "Wooden Washerwoman"
93. T. T. Hougbton, automatic clothes washer and boiler.

Class 11.

Minerals and Mineral Substances, Coal, etc. Judges: L. M. Kellogg, O. W. Easton, Melville Attwood.

46. North Star Gold Mining Co., specimens of ores and map.
123. G. Knstel, five cases mineral specimens.
271. D. E. Cotter, specimens from the Sandwich Islands.
204. Redington & Co., electro-silicon.
350. G. L. Wratten, electro-silicon.
205. M. Lane, silver ore from North Star ledge.
312. M. W. Baldwin, copper ore, Arizona.
335. Thos. C. Cave, quartz from Morning Star ledge, Nevada.
359. M. Scott, copper, silver and gold ores from Alpino County.
357. Oregon Iron Company, samples of iron and iron ore.

Class 12.

Chemical and Pharmaceutical Manufactures, as Alkalies, Acids, and all other manufactures and processes, Pharmaceutical substances and processes of production. Judges: Dr. James Blake, James Steele, Thomas Price, Arch. Cooper, E. T. Martin.

42. Mrs. H. T. Wood, 1 box patent ointment, California manufacture.
196. Crane & Brigham, case of California sulphate of copper.
253. Bay View Chemical Works, samples California made sal soda.
383. M. H. Garland, patent cough drops.
91. Dr. G. B. Tolman, one case chemicals, California manufacture.
31. S. Adams & Co., one case California made inks.
7. Standard Soap Company, one case chemicals.
74. H. H. Bancroft & Co., Occidental patent ink, California manufacture.

Class 13.

Jewelry, Silver and Plated Ware, made of Precious Metals, and their Imitations; Precious Stones, Lapidary Work, Gold Pens, Hair Jewelry, Plated Ware and Galvanized, Plastic, India Rubber Jewelry, etc. Judges: F. B. Hart, B. F. Avery, Job M. Seamans, O. Gori, W. T. Garratt.

115. John Martell, silver-plated coach material.
132. Vandersliee & Co., two cases California manufactured silver ware.
158. P. A. Giannini, three gold watches in Vandersliee case.
170. Mrs. C Cook, two cases hair jewelry.
228. W. Hollander, California invented watch alarm.
235. San Francisco Plating Works, plated ware, California manufacture.
267. Com. T. H. Allen, silver speaking trumpet.
307. C. H. Hain & Co., two cases silver ware, etc., and clock.
390. Wm. Lynch, silver shield, coat of arms of Ireland and America combined.
24. H. Wenzel, one clock, California manufacture.
55. Braverman & Levy, two cases containing silver ware.
181. Mrs. B. Uszynski, case of hair jewelry.
216. F. Heinze, one universal clock.
219. C. E. Collins & Co., one clock, California manufacture.
325. W. H. Lamb, rachet for watches and clocks.
195. R. F. Rocchiccoli, chased goods, candelabria in bronzed figures, California manufacture.
10. Haynes & Lawton, silver and plated ware.
43. Mrs. Bolander, hair jewelry.
153. O. B. Oakley, silver plating, silver ware, etc.
3. H. T. Graves, door plates and letter-box, sash plates and rods, etc.

Class 14.

Lithography, Engraving, Ornamental Printing, Book Binding, Ornamental Boxes, Printing Material, Paper, Penmanship. Judges: Jacob Bacon, J. J. Rey, E. Bosqui, H. H. Moore, James Linen.

16. F. E. Beck, specimens of penmanship, Lord's prayer.
17. P. Espina, San José, specimens of penmanship.
20. C. E. Wolf, map drawn with the pen.
21. California Business University, specimens of penmanship.
24. F. M. Truworthy, specimens stencil cutting.
36. J. B. Grouppe, wood engraving by boy 15 years old.
125. G. B. Hitchcock & Co., California made books, etc.
134. G. M. Wood, specimens of stencils.
193. J. P. Upton, specimens card printing.
287. Cubery & Co., specimens printing and frames.
293. L. M. Fernandez, specimens of penmanship.
374. H. Page & Co., samples of monograms.
120. J. Breidenstein, jewelry boxes and fancy ornaments.
322. J. M. Rice, paper made in Sandwich Islands.
329. E. S. Colburn, two pictures executed with a pen.
334. A. Mussard, four goblets, samples of engraving on glass.
345. Pacific Business College, specimens of penmanship.
370. T. Sargent, lithograph picture.
12. Knox & Roos, engraving.
15. W. V. Gray, lithograph of San Francisco and key.
20. A. Foreman, Foreman's improved type machine, California invention.
23. Wm. Faulkner & Son, type-casting machine
32. Palmer, Knox & Co., printing press and inking machine.
67. Wm. Wallace, fancy penmanship on cards.
74. H. H. Bancroft & Co., publications and patent ink.
97. Dewey & Co., proprietors of the MINING AND SCIENTIFIC PRESS, one printing press, issuing, gratuitously, the third volume of the MECHANICS' FAIR DAILY PRESS.
112. J. G. Hodge & Co., stationery.
126. Frank G. Edwards, machine for manufacturing wall paper.
138. S. P. Taylor, California made paper.
211. Teubner & Hoffman, jewelry boxes.
231. J. Girvin, paper mills from Sandwich Islands.
255. S. Whitney, set California Reports and Practice Acts.
270. Miss A. W. McClelland, wood engraving.
309. H. C. Bateman, one case Bibles.
311. Mrs. B. V. Nichols, one pen drawing.
321. J. T. Bardwell, 1 lithograph.
332. Geo. B. Hitchcock & Co., copying presses, California made.
113. F. Entz, paper stencils.
148. W. Holt, penmanship and material.
—— W. B. Cooke & Co., books, stationery, etc.

Class 15.

Wagons and Carriages, etc. Judges: H. M. Newhall, John W. Farran, H. W. Byington, H. M. Black, F. Kohler.

154. A. Folsom, buggies and wagons, California made.
273. G. P. Kimball & Co., buggies and wagons, California made.
84. C. A. Fargo, patent brake and wagon, California invention.
200. Casebolt & Kern, four buggies.
256. J. H. Arnold, adjustable carriage pole.
294. Charles A. Way, velocipede, California invention.
322. Moore & Edwards, buggy, with an attachment to prevent horses from running away.
345. Deitz & Co., buggy shackle.
366. F. A. Huntington, buggy.
374. Gallagher Bros., butcher cart.

Class 16.

SECTION 1. Harness and Saddlery. Judges: W. H. Baxter, J. B. Dorr, Josiah Swain.

312. Main & Winchester, Saddlery and Harness.
316. J. Hamilton, circus performer's saddle.
80. Main & Winchester, harness, robes, whips, etc.
130. G. Vellengar, saddles in case.
153. F. T. Houghton, side saddles.
323. A. P. Beatty, San José, one bullion bridle.
98. M. M. Cook & Son, California made collars.

—

SECTION 2. Boots, Shoes and Leather. Judges: J. C. Johnson, T. R. Hayes, J. B. Roberts.

32. Co-operative Union, California made boots and shoes.
180. P. Kelly, California made boots.
234. W. F. Burke, California made boots.
247. L. Price, California made boots.
279. Wm. Bloom, California made sheep-skins, alum tanned.
380. Mrs. S. F. Kendrick, Chilcott's patent flexible boots and shoes.
110. L. Hoffman & Co., California tanned calf and kip skins.
119. Pacific Tannery and Boot & Shoe Co., California made leather and boots and shoes.
248. Tyler Curtis & Co., California manufactured leather.
290. Wentworth, Hobart & Co., California manufactured boots and shoes.
351. Buckingham & Hecht, California manufactured boots and shoes, and wire quilting machine.
393. A. H. Hale, Hill's patent elastic inner soles.

—

SECTION 3. Hose, Trunks, Valises, Carpet Rags, Leather Buckets and Fire Caps. Judges: Wm. Sherman, W. S. Phelps, F. E. R. Whitney.

98. M. M. Cook & Son, fire hose and belting.
67. Henston, Hastings & Co., trunks, valises, etc.
72. E. Galpen & Co., trunks, valises and carpet bags, California made.
75. J. Pointer & Co., trunks, valises, etc., California made.
164. H. Royer, leather belting and lacing,
191. J. J. Fulton, fire hose.
284. French & Co., trunks, etc., California made.
—— Mrs. H. L. Webb, new patent California trunk.

Class 17.

Signs, Wood, Glass and House Painting; Graining of Wood and Marble. Stalking and Polishing Wood, Block Letters, and Engraved Signs on Metal. Judges: Henry Kenitzer C. E. Lang, L. M. Kellogg.

52. Horst & Visby, samples decorative painting.
165. J. W. Cherry, sign painting and block letters.
183. Geo. A. Brush, sample of painted doors.
87. Wm. Patterson, metallic signs.
371. John D. Boyd, wood polishing.
96. P. Gibot, block letters.

Class 18.

Plain and Ornamental Furniture, Inlaid Work, School Furniture, Desks and Show Cases, Billiard Tables and Balls, and Works for Amusement. Judges: James Easton, A. Cuneri, Chas. M. Plum, Geo. T. Grimes, J. G. Eldredge, H. Steinnigger, H. J. M. Trout.

23. Eureka Hair Co., two bales Eureka hair.
25. Wm. A. Byrnes, cricket and base ball bat.
35. Dr. C. Farno, checker-board table.
63. C. D. Hinckley, samples of wire and bed springs.
94. Moore, Westley & Co., California invented bedstead (model).
161. F. Dreyfelicher, inlaid box.
167. W. S. Torrey, bedstead, with California invented mattresses.
176. Kruger & Slocum, two bedsteads with patent spring bed.
177. W. L. Torrey, three bedsteads and one lounge, patent spring.
232. L. Castagnino, California made furniture, inlaid.
241. R. Leschfeld, two California made billiard tables.
261. Schueter & Volkening, cornice and drapery of paper.
276. G. W. Sharp, one bottle samples of California pulu.
305. C. H. Jenkins, inlaid table.
324. C. Newbeia, laurel wood writing desk.
326. J. Moyle, one inlaid box.
337. Johnson & Rest, secretary book-case.
367. E. Lamy, nineteen black walnut brackets.
371. John D. Boyd laurel furniture, California made.
376. T. Westley, model California patent sofa bed.
85. Goodwin & Co., California manufactured furniture.
38. Pacific Rubber Stamp Co., samples elastic sponge.
148. W. Holt, school furniture.
151. McElwee & Ackerman, carpets, curtains, etc.
155. S. Tonnar, rustic settees and chairs.
166. T. T. Wimship, inlaid box made on board "Shubrick."
172. G. Rolland, California made inlaid floor.
194. Strahle & Hughes, California made billiard table.
206. S. T. Damon, patent baby tender.
254. Wismore & Palmer, cabinet furniture.
216. J. Beauchamp & Co., Eureka turnitnre polish.
343. N. P. Cole & Co., California made furniture.
79. J. D. Patrick, California invented bowning alley.
26. Phillip Ilinkle, two folding spring patent bedsteads.
30. Jones, Wool, Whittier & Fuller, looking-glass and frames.
123. S. C. Bradshaw, Payson's gymnastic swing.
—— Snow & Roos, one carved and gold picture frame,
—— James Lick, thirteen frames ornamental gilding.

Class 19.

SECTION 1. Work from Real and Imitation Stone, Marble, Plain and Ornamental Work; Emery, Polishing Powders, etc. Judges: Louis Larseneur, F. Williams, Wm. Patton.

150. S. Dinsmore, two inlaid marble top tables.
242. M. Heverin, two marble mantels.
148. Thomas Robinson, California grindstone, from Alameda County.
203. E. T. Steen, patent artificial stone, California manufacture.

—

SECTION 2. Sculpture in Stone and Plaster, Works of Art, and Ornaments in Stone or Plaster of Paris; Castings, etc. Judges: Joseph Britton, B. R. Norton, O. Gori.

168. P. Mczarra, busts in plaster, etc.
285. Arthur Lemmon, one bust and column.
201. P. J. Devine, one bust in marble, made by exhibitor
54. R. H. Stretch, plaster model of Virginia City.
56. Sam'l Kellett, plaster ornaments.
238. A. Petanghi, "Sleeping Child," in marble.

Class 20.

Oil, Soap, Candles, Whale, Lard, Sperm, and Fat, and Animal Oils: Linseed Oil, Olive, Castor Oil, Turpentine, Pitch, Tar, Resin, Camphine, Soap, Petroleum Oils, Paints, and Colors. Judges: R. H. McDonald, Charles Langley, J. R. Deane, W. B. Swain, W. R. Cranna.

56. Pacific Oil and Lead Works, samples California made oils.
92. O. A. Olmstead, mineral paints, from Sonoma County.
105. Epes & E. G. R. Ellery, patent India rubber paint.
185. Wm. Parsons & Co., Bowman's washing compound.
286. Whittier, Fuller & Co., neatsfoot oil and glue.
295. San Francisco Candle Company, California made candles.
7 Standard Soap Company, California made soap and candles.
16. J. Herkimer, California made blacking.
33. H. Lake, California made blacking.
53. Eureka Soap Company, California made soap.
59. C. G. Kelly & Co., washing fluid, etc.
109. John J. Hucks, axle grease.
289. Hill & Terreynes, California paint, etc.
300. G. Louis, California olive oil.

Class 21.

SECTION 1. Paintings in Oil and Water Colors, and Crayons. Judges: J. Mora Moss, B. P. Avery, Noah Brooks, F. B. Harte.

1. Emma Krans, crayon drawing.
30. M. Burgess, ninety-seven crayon drawings.
71. J. Reynault, one picture by a child aged 14 years.
79. G. H. Burgess, water color painting.
84. Mrs. S. M. Brady, one oil painting.
98. Mrs. N. W. Hutchinson, two oil paintings.
110. C. Gallman, oil painting by girl 14 years of age.
117. J. W. Mahood, drawing of fish by girl 12 years of ago.
119. Miss C. Mahood, drawing by girl 13 years of age.
147. Jas. A. Kerr, three water color paintings.
155. E. Schmidt, one water-color painting.
156. L. Schmidt, one water-color painting.
180. W. H. Hilton, Indian sketches, "Arizona Life" and "Crossing of San Pedro River."
163. H. J. Frey, thirteen oil paintings.
169. Geo. Howes & Co., water color, "Viscata."
184. Wm. Blair, oil paintings.
184. Miss McKee, oil paintings.
221. Mrs. A. McHenry, three oil paintings.

—

LIST OF ARTICLES ENTERED BY COL. WARREN, From the Cal fornia Farmer Office.

Two cabinet cases, containing a large collection of the early productions of California, viz: First box raisins exhibited at State Fair, 1853; samples of rosin, sugar, quicksilver, cocoons, silk floss and woven silk—first samples of about 100 varieties, all rare and valuable; a collection of gold and silver ores, copper ores and minerals, in great number; large crystals, agates and marbles, chunabar, etc.; sample piece of silk velvet, the first that conveyed Lafayette to this country; puffy hlock used by Ben. Franklin in 1732, in Philadelphia; collection of rare things from all parts of the Pacific Coast, forming a cabinet of about 500 pieces; samples of lava, sulphur, and rare volcanic specimens; also Indian relics, European gems, rare woods, etc.; a collection of corals and shells, rare and curious.

One case rare fruit and flower seeds—many from Java, Hongkong, India, Sandwich Islands, Cape of Good Hope, France, England, etc.

Five models.—The American gate, the best yet invented; the ditcher, a valuable invention for diking; the new apple-pealer; a corn cultivator, and a sugar evaporator.

Tibbs' new patent churn; patent hay fork; cheese cord cutter; True's potatoe digger, and Allen's new weeding hoe.

Collection of animals almost unequaled.—The duck-billed platibus, a curiosity; monster gopher, turtles, horned toads, etc.

Blocks of wood from the Mammoth Tree Forest; wood and bark from the "Father" and the "Mother of the Forest."

Two cases birds—one from South America, one of California birds.

A pyramid of polished stones from the beach at Peseadero.

Two statues—one of the Goddess "Flora," one of Washington.

The original bag of flour, in white satin sack, gold letters, as shown at the first Agricultural Fair in San Francisco, 1853, fifteen years ago. Made by John M. Horner, at the Union Mills, Union City.

Block of marble from Suisun; three do from Columbia.

Oil paintings.—Gen. Sutter, painted by S. W. Shaw, in 1852; "Lang Syne," painted at Boston, by H. C. Pratt, in 1827; "President Lincoln and his Generals at the Last Council of War at the Battle Front," painted by Hill; "Check-Mate," by Brooks; two Newfoundland dogs—English painting; two "Ideals"; "May Queen," etc.

"Washington and Lady Washington," superb chromolithographs; Correglo's "Magdalen," and fruit piece, masterpiece from the Art Gallery of Prang & Co., Boston; life-size pictures, being photographs of the "Labor of Love," a copy of prize picture at Art Exhibition, London, in 1863; life-size "Flora and Pomona," copy of exhibit at Mechanics' Fair in 1865; model picture, retouched, of "Flora, Pomona and Ceres;" photograph of the building where the First Agricultural Fair was held in Sacramento, California, 1852; four specimens "California Farmer," printed on white satin; engraved pictures, large size, "World's Fair in London" and "World's Fair in New York;" "The Big Tree of Calaveras;" fruit piece of the first fruits in California, 1853, copy, by Dr. Thomas Logan, Sacramento; framed picture, containing two grass bouquets made at Nonantum Hill, Brighton and Newton, Mass, in 1816—now in perfect order: Mechanics' Pavilion, 1865, and six other photograph pictures; two oil paintings, grapes, perfect; one fruit piece; four Prang chromo-lithographs, animals, very perfect; four large drawings, fruits and vegetables.

Three large bound volumes, "Ellwoorth's Albumo Flowers and Vegetables."

Volume "Victoria Regina," the "Wonder Flower of the World."

Thirty pots greenhouse plants, principally new and choice seedlings; collection of choice fruits raised in San Francisco.

Coat of arms, being garden and farm tools arranged as emblems in the collection, and surrounded by the "Stars and Stripes."

For Frosting Windows, make a strong solution of epsom salts in lager beer, and apply with a sponge.

Copper Reduction Works at Virginia City

The *Enterprise* describes some newly erected experimental works, 40 by 25 in dimensions, for the reduction of Nevada copper ores by the wet way, situated on F street, and under the superintendency of John Ramdohr, the several features of which are: A quantity of ore digesting in dilute sulphuric acid in the first tank; the solution running from the filtering tank into the precipitating tank; precipitated with the powder of metallic iron; the precipitated copper in process of melting in a large crucible, to be molded into a bar, and a quantity of both the blue and green vitriol produced by crystillization. The ore is first dry-crushed to a fine powder, when it is placed in a large copper tank and subjected to the action of dilute sulphuric acid, heat being applied to the bottom of the tank (which stands upon a furnace), to hasten the process of dissolving the copper contained in the ore. When dissolved the solution is drawn off into a large filtering tank, and from this is conducted into a precipitating tank. In case it is intended to manufacture blnestone from the solution, it is conducted to the evaporating pans, and thence, after being sufficiently reduced, is placed in pans lined with lead, for crystillization, when it is ready for sale to millmen and others who have use for the article. For the production of metallic copper the process is precisely the same as for the making of blnestone, up to the point of running the solution from the filter. To obtain metallic copper the solution is conducted from the filter to a large precipitating tank, where it is precipitated by the use of metallic iron in a state of fine division, and at once becomes metallic copper in fine grains. The metallic iron used in precipitating the copper contained in the solution is obtained in the following manner from the ore itself, the ore (from Walker River) containing but 21 per cent. of copper and a considerable amount of iron. The crushed ore, just as it comes from the batteries, is mixed with a quantity of pulverized charcoal, placed in iron tubes or cylinders, and kept for a length of time at a certain heat, by which time the iron is annealed and becomes metallic, and then is ready to be used in the precipitation of the copper obtained in solution by the first process. This iron powder acts almost instantaneously, and all the copper in a tank of the solution, no matter how large the tank, may be precipitated in less than an hour. After the copper has been precipitated there remains in the solution sulphate of iron (green vitriol), and this is evaporated and crystallized in the usual way, when it is used for the manufacture of sulphuric acid, to be again employed in the process of dissolving the ore in the first operation. After the distillation of the sulphate of iron for the production of sulphuric acid, there remains behind in the retorts used, a substance called colcothar—a red oxide of iron, sometimes used as a pigment and for polishing glass. Thus it will be seen that the ore is made to furnish the materials by which it is worked; the only loss is about ten per cent. of sulphuric acid. To work copper ore by the new process will cost from $8 to $15 per ton, according to the price of fuel, facilities for obtaining ore, etc.

Street Watering.—Mr. J. W. Cooper has patented an improved system of watering the streets, which is being tried in the parish of Marylehone, Eng., and elsewhere, and promises to be successful. He introduces in the ordinary carts, when charged with water, a mixture, in suitable proportions, of fused chloride of calcium and chloride of sodium (common table salt). These salts, as is well known, are highly deliquescent, especially the chloride of calcium. When such a solution is applied to the roads, the retention of moisture by the chlorides serves to keep them in a damp condition for a much longer period than when ordinary water is used. By the present system of *deluging*, three applications daily are scarcely sufficient in warm dry weather to prevent the dust from blowing, whereas *one* application of Mr. Cooper's composition at intervals of two or three days will, it is said, effectually accomplish this object, and at a much less expense. The dust in the large rooms of warehouses and similar buildings, might doubtless be effectively controlled by adding a little of these salts to the water used.—*Gas Light Journal.*

Five Japanese students are at the Academy of Munson, Mass.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Weeks Ending Aug. 18th and 25th, 1868.

81,168.—Improvement in Direct-Acting Engines.—Wm. D. Hooker, San Francisco, Cal.:

1. I claim the auxiliary ports m, m′, together with the main ports i, i′, in combination with the main valve f, piston c, and auxiliary valve q, of a direct-acting engine, constructed substantially as described.

2. The arrangement of the auxiliary valve q, ports p, p′, and n, n′, in combination with the main valve f, and piston c, of a direct-acting engine constructed substantially as described.

3. In combination with the main valve f, supply ports i, i′, exhaust ports j, j′, auxiliary valve g, and ports p, p′, I claim the small ports l, l′, and k, k′, substantially as herein described.

This patent has been granted to Mr. W. D. Hooker, already well and favorably known on this coast as an inventor, and it consists of a device in which by means of two valves, one main and one auxiliary, the steam is caused to act on each end of the piston in the cylinder alternately without the aid of eccentrics, cams or tappets, while by a system of ports opening at different parts of the cylinder and valve chambers, the valves and piston are cushioned at each end of their stroke in such a manner as to allow a very high rate of speed without the danger of concussion. The auxiliary valve opens and closes the ports leading to the ends of the main valve chamber alternately by the action of the steam supplied and released at each stroke of the piston. The advantages of this engine are, first, its durability, simplicity, and cheapness, there being but three moving parts; two valves and the piston; and secondly, the certainty with which it starts from any part of the stroke, and the variable speed at which it may be run, from the lowest to the highest. It is especially adaptable to steam pumps and fire engines, where a high rate of speed is required, while all parts are readily inspected by removing a cover.

81,414.—Improved Car Brake.—S. W. Y. Schimonsky, Cheyenne, Dacotah Territory:

I claim the brake shoes G, rigidly attached to the frame D, sliding through the wheels E, upon the guides F, and attached to the lever I, all operating as described, whereby the shoes G, are alternately wedged upon each side of the wheel between the same and the guide F, as the lever is operated in either direction, as herein shown and described.

REISSUES.

3,097.—Improvement in Cultivator Teeth. Don Carlos Matteson and Truman P. Williamson, Stockton, Cal.:

1. We claim the double-pointed adjustable bit A, attached to the beveled foot of the curved standard C, substantially as and for the purpose specified.

2. The oblong blade or share D, in combination with the bit A, substantially as described, and for the purpose specified.

Masters' Hay Press.—During the last day of the San Joaquin County Fair, a new style of hay press, the invention of E. J. Masters, of Shaw's Flat, Tuolumne County, was brought forward for exhibition. It is called "Portable and Stationary Hay Press." The advantage over other presses which Mr. Masters claims for his invention, is that it can be drawn by a span of horses along a winrow of hay, or from cock to cock in a field, and press the bales while it is moving from place to place. The press is worked by horse-power. The hind wheels are fast to a revolving axle, which works the press. It is of sufficient size to make bales of 225 pounds in weight. The inventor has applied for a patent.

Australian Silver Smelting Products. The Talisker Silver Mining Company, South Australia, have sold in London, during the past six months, five shipments of silver lead, weighing 103 tons, and containing 7,475 ounces of silver. There are now in transit to the company's agents, in London, five other shipments, weighing 122 tons, and containing 9,028 ounces of silver, making a total of 16,503 ounces of silver and 225 tons of lead shipped during the past six months.

[From the Mechanics' Fair Daily Press.]

Retrospective.

What have we seen in the Fair of 1868? Financially and managerially, a success; industrially, the myriad interesting details of all the arts and trades, and the gratifying advanced status of mechanics and manufactures, of economy and the comforts of home life, on the Pacific coast. Socially and individually, have we not all learnt more concerning each other, and seen more of unaffected human nature as it manifests itself without hiding its working machinery—between childhood and old age, coupled or seeking to be coupled, quiescent, or restless—in the exhibition during our frequent visits, than we have at all the theatres and parties throughout the year? We have not crucified ourselves with any hard "study," and yet it has been a university to all of us, because it has enabled us to build up in our minds what we were striving, perhaps unconsciously, to assimilate.

What are the results? None can tell but the great Designer, who plans communities, and maps out destinies of a thousand years, as the artist lays upon canvas his matured conceptions.

This is the sixth exhibition of the Mechanics' Institute—and it is not the least, nor the greatest, of either the past or the future. Though it has been, generally, the most satisfactory one thus far held, it is not half as good as it might have been; nor half of what, let us hope, the next one will be, in unanimity of impulse on the part of our industrial elements to present to the community the best devised and most suggestive exhibitions possible, representing everything and everybody of any account in his own special field—a result to be attained more by judicious management on the part of the Institute than by any other cause.

One may read the signs of the times in the Fair, and at the same time prove the conclusions arrived at by comparing the present with the previous Exhibitions. Mining was the great feature at the last Fair; the woolen manufactures lead in this. Without speculating as to the final and permanent position of wine-making, and silk-growing, or of other pursuits which still suggests doubts to those who propose engaging in them, we may safely conclude that the little pursuits and specialties which tend to advance home comforts and the economy of living on this coast, will continue to spring up, and will all flourish, like our own eastern seeds in California soil. The old-fashioned home-made carpet weaving business,—to cite an example,—is not only represented amongst the new industries of the Fair, but it is making profits for the introducer. Our former extravagant prices must tend inevitably towards striking an average with the low prices of the products of labor in China; and there appears to be no human agency powerful enough to prevent it.

Mechanics' Institutes originated in England and Scotland about A.D. 1800, when a course of lectures was delivered by Dr. Birkbeck, at Glasgow, the object of which was to furnish instruction to the toiling world in popular and applied science. Now there is not a town of 10,000 inhabitants in the British realm, but rejoices in its Mechanics' Institute, where short courses of lectures, illustrated by experiments, are given, classes taught, and circulating libraries afforded to all at a moderate price. Our own Mechanics' Institute was organized in 1855, in a small way; it prospered slowly but surely till 1863. Energetic citizens then came to the rescue, and in 1864, 1865, and 1868, the exhibitions were repeated, uniformly with success, and the data and significant features were historically perpetuated by the publication, throughout the continuance of those fairs, of the Mechanics' Fair Daily Press—an unpretending institution, which nevertheless presents itself confidently to the reader with a consciousness of being itself one of the signs of the times.

The Great Railroad Building.

Holmes has written a verse which embodies pithily the present chief industrial event of the Pacific:

Here sun-browned labor swings his cyclop arms,
Long are the furrows he must trace between
The ocean's azure and the prairies green;
Full many a blank his destined realm displays,
Yet see the promise of his riper days:
Far through yon depths the panting engine moves,
His chariots ringing in their steel-shod grooves;
And Tahoe's naiad flings her diamond wave,
O'er the wild sea-nymph in her distant cave.

We have merely written "Tahoe" where the poet said "Erie;" that is all. What he says about the sea-nymphs, might be deemed inapplicable to our rock-ribbed shores,—though they are cavernous and mossy, and romantic enough on a calm afternoon, and very weird in a storm,—for no Californian who has learned to handle the frying pan can be very easily humbugged into any faith of mithological naiads and nymphs ever having been seen in this longitude. But those lines are as true as the rest; the poet merely referred (prophetically) to the sands of Santa Cruz, and then bethought himself of the pretty sights which are witnessed sometimes by the juniper trees of Bonudary Point overlooking the Warm Springs in surrounding cold waters, which have been found by the nymphs aforesaid, at the northern end of the Tahoe Lake.

Manufacturing Machinery.—The progress of manufacturing in a new country can be told better, perhaps, by the quality and quantity of the manufacturing machinery which is turned out, than in any other manner. Taking the shingle machine at the Fair (made at the machine works of Geo. T. Pracy, on Mission street), for an example: it is a beautifully constructed machine, solid and substantial, evidencing that in the country where its several parts were manufactured, the skill and perfection of both wood and iron handicraft have made themselves a home. There are over 20 of these machines, invented by Mr. Huntington, now at work in different parts of the State, viz.:

With Hanson & Co., Redwood City, 2; Rice & Halliburton, Woodside, 1; S. P. Pharis, Woodside, 1; A. Saunders, Woodside, 1; Wm. Page, Mayfield, 1; McPherson & Wetherbee, San Francisco, 1; Pope & Talbot, San Francisco, 1; Harrington & Co., Pescadero, 2; Burch & Co., Pescadero, 2 (both running with an eight-inch cylinder engine); A. Anderson, Pescadero (run by water power) 1; J. Tufly, Pescadero, 1; Rutter & Co., Pescadero, 1; R. Walton, Emigrant Gap, 1, and several others not noted.

A visit to Mr. Pracy's establishment will disclose great activity besides, in the manufacture of other kinds of mill machinery in general, on orders from out of the way places which, having hitherto been possessed of but little more than a "local habitation" in geography, will not be long thus in procuring themselves a name.

In an advertisement in another column of to-day's issue, we see that Mr. Pracy has several specialties at his shop. We have known Mr. Pracy for years, and noted his industry and close attention to the business in which he is steadily progressing, to his own credit and the advantage of his customers, a large portion of whose work is of the most difficult character to execute in a satisfactory manner.

Perforated Patterns.—A convenient means of marking out lines for embroidery is made use of by F. Entz, in the gallery. A peculiar transparent paper is used for tracing any desirable design; it is then perforated, and a brush with a light blue powder is applied over it in such a manner as to mark the goods. A good operator can readily produce the same on the sewing machine, in a few days' labor. It is a new idea for needle-workers, giving to the ladies an opportunity not only to learn to sew neatly, but to cultivate a taste for drawing at the same time.

W. A. White's patent sad iron holder protects the hand from heat while ironing. It is just the article that women have wished for thousands of times.

A new cable has been laid between Victoria, V. I., and the main land.

To Inventors

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intentions of becoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Patent Rejections.

First. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

Second. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

Third. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Re-Issues.

When, through "inadvertence, accident, or mistake," an *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can be cured by a *re-issue*. In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from $20 to $40.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 y'rs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, September 12, 1868.

City Stocks.

During the past week miscellaneous stocks met with slight inquiry in the open market. Sales of Spring Valley Water were made at $66 50, and San Francisco Gas at $77 75. The Front Street, Mission and Ocean Railroad Company have declared a dividend of 1¼ per cent. per month on preferred stock, for the past three months, payable on and after the 20th instant. The North Beach and Mission Railroad Company will disburse a dividend of ¼ per cent. on the 15th inst., and the Omnibus Railroad Company the same amount on the same day. The City Railroad Company have levied an assessment of $2 per share, delinquent on and after October 10.

The usual monthly dividend of the Bank of California—1 per cent. on its capital stock—is payable on the 15th inst.

Mining Share Market.

The mining share market shows a marked depression since our last similar reference, those stocks mostly dealt in exhibiting the greatest decline. Very material fluctuations have taken place from day to day, and upon the whole the transactions as compared with the previous week have not been near so large. In a falling market the majority of small speculative dealers decline to purchase, but so soon as stocks have almost reached their limit of advance, they make the freest purchases and in many cases suffer quite severely by a rapid decline, in many instances superinduced by the action of heavy holders. However, at present the rather unfavorable news from the principal mines adds greatly to the depressed condition of the market.

Crown Point—has been less active as compared with last week, selling within a range of $70@64, then at $69, and at the close realizing $66 50. The mail reports to the 8th inst. state that the stopes between the 700 and 800 levels are gradually giving out, the upper floors first showing a diminution. The south fork of the east drift, on the 900 level, is in to the wall, a distance of 240 feet from the shaft, and the Superintendent is disappointed in not finding ore before reaching the wall. In drifting north about eight feet they found no favorable change in the ground, while the winze of the north fork of the east drift is down about forty-two feet, and from the top has carried its full size in superior ore. The face of the north fork, east drift, now in a distance of 220 feet, is almost entirely in quartz. The south drift on the 800 level is in over 230 feet and still shows good streaks of ore in the face. The bullion returns in August amounted to $103,293 against $145,923 in July, and $116,000 in June. A dividend of $5 per share is payable to-day. By later mail advices we learn that the shaft is 69 feet in depth below the 900 level, and in hard rock. By telegraph of the 11th, the north drift was in 225 feet, with face in quartz and looking encouraging.

Kentuck—declined from $420 to $400, improving to $411, and closing at $372 50 ex dividend. The total bullion receipts in August were $164,540, against $138,860 in July, and $120,766 in June. The expenses for the month just closed were about $88,000. A dividend of $30 is payable since the 10th inst.

Savage—has been quite largely dealt in at a decline from previous rates, selling at $109 50 @86 14, and closing yesterday at $86 50. During the week ending Sept. 5th 1,026 tons of ore were extracted showing an average assay value of $33 95 per ton; previous week, 1,131 tons were extracted, valued at $36 34 per ton. They are finding considerably more ore on the third station, north mine, than they expected, while the breasts in the south mine, on the fourth level, are not looking as well as heretofore; however, the difference is not sufficient to account for the falling off in the general average value of the ore. The east breasts are poorer, while the west are said to show a marked improvement. On the fifth station, south mine, the north winze is nearly sixty feet in depth on the incline, and a cross-cut is being run east, but so far no new developments have been made. The south winze, in following the ore, gets so flat, at a depth of thirty-five feet, that no headway can be made on account of water, and for this reason a cross-cut was started eastward from the bottom, and has been carried twelve feet through good ore. No change on the sixth level, the drifts, north and south, being over seventy feet from the forks of the tunnels. The bullion returns for August aggregate $187,141 against $279,788 in July, and $384,675 in June. A dividend of $5 per share is payable since the 11th inst.

Empire—remains quiet. Sales have been made at $115, seller 30. The bullion receipts at the office in this city for the month of August aggregated $20,645 72 against $20,464 45 in July, and $20,659 in June.

Chollar-Potosi—has been somewhat more active, declining from $175 to $153, and closing at $155. For the week ending Sept. 4th they extracted 1,004 tons of ore from the New Blue Wing stope, against 1,205 tons the previous week. The various faces in the stope have not changed since the previous report. The 14th and 15th floors promise to keep up the present daily supply of 140 tons. Considerable progress has been made at the 1,000 and 1,100 stations, the northeast drift on the 1,100 level showing a mixture of porphyry, clay and quartz, while the southeast drift is in hard porphyry. Three mills are now employed in reducing ore for this company. The bullion returns for August foot up $97,993 20 against $86,029 37 in July, and $76,563 in June.

Overman—sold to a considerable extent, rising from $80 to $97, declining to $81, and closing at $89. The Vivian and Sacramento mills are now being supplied with ore taken from the 361 level, which averages about sixty-five tons daily. They have taken about fifteen tons of high grade ore from the 500 level. They are extending drift south on the 400 to meet the body of ore on the 300 level. From the 300 level, it is reported, they are taking some fine ore.

Amador (Cal.)—sold at $257 50@246. The receipts for August amounted to $44,250 against $47,500 in July, and $45,630 in June.

Yellow Jacket—advanced from $1,230 to $1,290, declined to $1,235 and closed at $1,270. The 700 level is yielding some very fine ore, and it is believed that the mine is looking better than for months past.

Imperial—has been more active, selling within a range of $111@107 50, and closing at $107. Hard rock is encountered in sinking the main shaft, the south end of which is now sixty feet in depth. They have raised eighty-five feet from the 900 level. The winze from the 700 level of the Alta mine is down sixty-six feet, the ore on this level showing no change. The west body on the 600 level is producing eighteen tons per day, and from the Alta mine they are extracting about 110 tons per day.

Gould & Curry—sold at $100@90, closing at $92 b. 10. During the week ending Sept. 6th, the Bonner shaft was carried to a further depth of 10½ feet. Still have the small seam of ore previously reported.

Hale & Norcross—declined from $77 to $50, and closed at $56 25. They are extracting ore from several localities on the lower level, but as yet the value of the same has not been ascertained.

Exhibition of Dentistry.—The showcases of Dr. E. O. Belle, in the rear Art Gallery, contains skulls of various animals, and exhibits a variety of teeth which are especially interesting to the lover of science. On top of the case we noticed a perfect representation of the upper part of the human mouth, made in wax, and copied from nature, which shows the most varied antagonism of teeth, and the different stages of decay which ordinarily takes place. Beside the case is one of Dr. Belle's patent instruments for the extraction of teeth without pain, which fully answers the purpose for which it was designed, as hundreds in the city can testify. The material used in the mouth during this operation is entirely tasteless, and there is no ether to be inhaled by the breath. The shock given to the system of delicate females and children, which often lasts for months, is avoided, while those of stronger constitutions find its use a great relief. Dr. Belle is a skillful dentist, and has full sets are models of chaste workmanship. His place of business is at 408 Pine street, near Montgomery.

Successful Working.—It is gratifying to learn that the ores of the Enterprise mine, at Meadow Lake, Nevada county, are now being treated very successfully by the Hagan furnace process, by the Pacific Ore Company. We shall give further particulars soon.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Tin Mines in Colorado.—The standing bounty of the national government for the discovery of a genuine and permanent deposit of tin, has never been awarded. Colorado presents a new claimant in a vein which is thus spoken of:

It is tin ore of the very richest kind—of the variety known in Cornwall as the "resin tin ore." He—a Cornish visitor—says he never saw richer or more perfect ore raised in Cornwall. We have plenty of it. The Spicer lode crops out for about three-eighths of a mile, and seems to be 100 feet wide—all of the same kind of ore we send you. We are sinking a shaft as fast as possible, but have not yet defined the crevice, but are taking out slathers of ore. The Eureka lode is from eight to sixty feet wide, in a defined crevice—all of this kind of ore. This I believe is the first oxide of tin ore ever discovered in America. The tin ore discovered in Missouri was sulphate of tin.

The Golden State, is the name of a newly invented double-action force pump, placed on exhibition by Mr. M. D. Lasswell, the inventor, 747 Mission street. The most novel and attractive feature here presented, is in the attachment of the small valve peculiar to the hydraulic ram, which has not heretofore, so far as we are aware, been applied successfully to any other pump. The inventor claims that by this arrangement, this pump will give far more water than the solid contents of the cylinder, say from seven to ten barrels per day; that while it works very easily, it is as durable as any pump ever built, and more easily repaired than any other in the market. The rapidity with which its different parts can be put together and again taken apart, is remarkable. Another striking feature of this pump is, that while it is mainly of cast iron, its working parts are of brass, giving it the chief advantages possessed by a pump constructed entirely of brass. One of these pumps is attached to Mr. Tustin's Adjustable Windmill, in the yard of the Pavilion.

Hooker's Steam Pump, on exhibition, works very efficiently. It seems to appropriate a large percentage of its power in the right direction. It is remarkably small, compact, and simple, for the amount of work it performs. The flow of water starts and stops instantly with the motion of the check valve. Mr. Hooker, in addition to his several inventions, has recently patented an improved steam engine, which he will probably bring to public notice soon. We like his sturdy, modest demeanor, and believe he has a bright future, as a successful inventor and mechanic.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Aug. 29th: The Leviatban Co. sunk this week on their ore deposit sufficient to encourage them to get a pump and keep on down far enough to determine the extent of the body.

There was a strike of quartz in the Rippon claim a few days ago and quite an excitement consequent thereon.

Chronicle, Aug. 29th: Supt. Slaven this week has taken out of the IXL mine, richer ore than ever before. He increases his working force as fast as good miners present themselves.

Robert Ludgate and Jack Miller, of Ione City, discovered and located a coal mine, last week. It is about two miles southeast of Ione City, and the croppings are said to equal the best coal taken from the old mine.

Amador County.

Jackson *Ledger*, Sept. 5th: Phillip Seibenthaler's new quartz mine on Foster's Ridge, above Volcano, continues its rich yield. A drift 80 ft. southerly, was found to contain ore equal to the best in the shaft, and the run of 66 tons paid over $25 to the ton.

The Italian mine, on Else Creek, is turning out ore that would cure the most chronic case of sore eyes.

Old Boh's claim continues to increase daily. The vein is now over ten feet wide, and the rock taken out looks splendid. There is one encouraging feature about it, not a single piece of the rock that has been tried in the mortar has failed to produce gold.

The noted quartz mine at Pine Grove, known as the Anaconda, has been sold to parties in San Francisco. Steam hoisting works will be immediately placed upon the Anaconda. Fine rock has been taken from the main shaft within the past two weeks, and it is believed by those who know the mine, that the purchaser has made a good and certain investment.

At a depth of 375 ft. the lode in the Casco mine has been found seven feet wide, and the rock is of a very flattering quality, in many places showing free gold. Preparations have been made to erect a 20-stamp mill on the mine.

Dispatch, Sept. 5th: The Kennedy mill has been completed, and will commence crushing rock some time during the coming week.

Calaveras County.

Mokelumne Hill *Chronicle*, Sept. 5th: Hardenburgh & Co, whose mine is located near Middle Bar, have struck very rich ore at the depth of 300 ft. It is said that the rock will average $100 per ton.

The Rich Gulch correspondent writes: From the level now being run from the north shaft southerly, there is being taken ore of a higher grade than the Palomo Mining Co. have extracted heretofore. In the opinion of those best able to judge, the extension of this level for about 50 feet further will strike the rich chimney known to be at or near that locality; so that by the time the additional battery is erected and the sulphuret works completed, there will, I think, be returns from ore reduced at this mine that will cause "Mrs. Petticoat" to look to her laurels.

Nothing new from Alexander & Co. The same old pounding is still going on; their battery never stops.

Mr. Smith's claim seems to be in somewhat of a fix.

Kern County.

Havilah *Courier*, Sept. 1st: On Sunday afternoon some Chinamen commenced prospecting on the south side of Copperas Brauch, at the foot log. The Chinamen obtained a good prospect, and it is believed that there are good placer diggings on this branch.

Los Angeles County.

Star, Aug. 8th: The tin mines at Temescal are turning out very well. There are about a dozen Cornish miners at work, who are sinking on the ledge, which is down 30 feet, and exhibits a vein fully 5 feet wide. Ore of a very high percentage has been struck.

Mariposa County.

Mail, Sept. 4th: Already much of the damage done by the floods of last Winter has been repaired, and in a short time the mills will be in successful operation again. The new 20-stamp mill belonging to John Hite, of Hite's Cove, is successfully running and crushing the rich ore taken from his inexhaustable mine. The mine in Hunter's Valley, known as the Oakes & Reese vein, is producing rich ore and getting better every day. A new water mill is in course of construction at the Buckingham Mountain; the company has already on hand, ready for crushing, about 100 tons of rock, which they consider rich in the precious metal. The Mariposa Co. has commenced work in earnest on the dam at the Benton Mills, on the Merced river.

Nevada County.

Transcript, Sept. 2d: Harvey Boone, Superintendent of the Kentucky Gravel Co., has gone to Gold Hill, Nevada, to see whether the stockholders desire to have the work continued on the mine or not.

Sept. 3d: The North Bloomfield Gravel Mining Co. is engaged in building a ditch from the South Fork of Poor Man's Creek, in Eureka townsbip, to carry water to the miners of Bloomfield township and the ridge. They are increasing the force at work as rapidly as possible, and expect soon to have 1,500 Chinamen in the line of the ditch. The company some time since bought a number of mining claims near North Bloomfield, which they propose to supply with water, and all others who desire. On Tuesday last, the Co. filed articles of incorporation in the Secretary of State's office, with capital stock fixed at $800,000.

Sept. 4th: A party is engaged in working a small ledge near the Norridgewalk Mill, from which good pay is obtained. The rock is raised by a windlass, the owner takes it to his house in a wheelbarrow and works it in a small arastra. We understand that even by this slow process he is making a "good thing."

Thirty or forty tons of excellent rock from the Potosi mine is being hauled to the French Mill to be crushed.

Sept. 8th: Chas. Phelps, the original locator of Phelp's Hill, near Washington, in this county, made a rich strike, about six weeks ago. Mr. Phelps commenced running a tunnel into the hill, about three years ago, and has worked in it more or less every season. The tunnel has paid expenses ever since he commenced work, but about six weeks ago he struck the main channel of gravel. He does not know the width or depth of the stratum, but it is supposed to be from 10 to 12 feet deep and 100 feet wide. The gold varies from fine grains up to the size of a pea, and he has found lumps worth $52. We saw yesterday four ounces, in which the lumps were as large as the kernels of peanuts. As soon as the tunnel is run through, Mr. Phelps proposes to put on hydraulic power and wash the ground off.

Gautier and others have located, under the name of the Golden Co., a claim of 1,500 feet, on a ledge a mile and a half from Grass Valley, near Bocker's Sulphuret Works.

A few days since the Birchville Co., at Eureka, struck the ledge in their new tunnel and found it exceedingly rich.

The Lower Channel Co. have located 12,000 feet of ground for a tail-sluice, commencing at the southwestern terminus of the Lower Channel Co., in Penn Valley.

Gazette, Sept. 3d: A gentleman who came down from Graniteville lately, informs us that a rich ledge was struck there last week by two prospectors by the names of "Happy Jack" and "Tobacco Bill." The ledge is large and well defined, and miners think the rock will yield from $35 to $40 per ton.

The repairs and improvements recently made in the Banner Mill and Hoisting Works are completed, and the mine is yielding excellent quartz. The 30-stamp mill is continually at work, and plenty of rock is always on hand.

The New York Mill, formerly known as the Sneath & Clay, will commence crushing this morning a lot of 100 to 150 tons of rock from the Wagoner ledge.

Grass Valley *National*, Sept. 4th: Considerable prospecting is going on in every direction, and the gold harvest of Grass Valley and vicinity promises to be augmented.

The Union Hill mine had a clean-up on Wednesday, and from 150 tons of rock 206 ounces of gold were realized. This gives an average of $25 per ton.

Grass Valley *Union*, Sept. 1st: The Birchville mill is crushing 100 tons of float rock, picked up on their claims, which will pay $40 per ton. They have struck the ledge in their tunnel. Palmer, Cowles, Grandy & Co. struck a very fine ledge, some days ago, about one mile from the South Fork. They had some rock crushed at Black's Mill which yielded $35 per ton. Valentine & Co., of San Francisco, have bought three shares in the Golden Age ledge, and intend to erect a 10-stamp mill on it. The Jim mine's last clean-up was not as good as was expected. The Golden Eagle, 400 yards east of the Jim, is now in 400 feet, and expecting at any moment to strike their ledge. The rock of this ledge in the upper tunnel will pay over $50 per ton. Sweet & Co. are now taking out good rock from the mine, which is being crushed at Parramore & Co.'s arastras. It will average $20 per ton. The Star Co. are still running for their ledge. The Mountain Queen ledge, in God's country, is about one mile from the Star. The rock from the ledge I have seen prospected several times, and nothing in this district will compare with it. It resembles the rock of the Banner mine, of Nevada City. The company have struck the ledge in three different shafts, and it is from three to five feet wide. They are about to lease the Star mill, in order to have a crushing.

Plumas County.

Quincy *National*, August 29th: Joe Hickman, on the North Fork of the Carihoo, has one of the richest and best paying mining claims in the State. Week before last he took out, working alone with a rocker, over six ounces. His claim consists of a bowlder deposit capped over with cement, cropping out on the bluffs of the North Fork. This deposit can be traced for miles, and has only been tapped at Carihoo, where several other companies are getting big pay in the same deposit.

San Bernardino County.

Guardian, Aug. 8th: The miners on Lytle Creek were doing well. Harpending & Co. were preparing to build a large flume. A party of Frenchmen have been making $40 a day.

Tuolumne County.

Sonora *Democrat*, Sept. 5th: James Tulloch is working a mine on Green Spring Run, near Byrne's Ferry. He has a shaft sunk on it to a depth of 70 feet, and at that depth the vein is 3½ feet wide. The vein is not of the "pocket" character, but the gold is fine and diffused through the rock. One ton of average rock taken from a depth of fifty feet, recently crushed in an arastra, yielded $15, free gold. The vein runs on the east side of the copper belt. Mr. Tulloch intends to shortly erect a mill on his mine, as he is satisfied that it will pay well.

The Portuguese Co., now working the East Fork claim formerly owned by Van-Matre & Co., are averaging half an ounce a day to the hand. A number of other Portuguese miners have lately located or bought claims in that vicinity.

ARIZONA.

Prescott *Miner*, Aug. 15th: Work upon the Chase is progressing. The ledge in the new tunnel is looking well.

In Big Bug things look smiling. Smith & Gaviu are building their arastra, and three or four placer mining companies are at work sluicing.

On Lower Lynx Creek and the Hassayampa, the placer miners are doing well.

Our Wickenburg correspondent says the mills are doing better than ever.

Shoup, Griffin & Lovejoy had considerable work to do in their hydraulic claims, before they commenced piping, but everything has been fixed up snugly, and they are now tearing down the banks in regular Timbuctoo style.

Aug. 22d: Late news from Big Bug is that placer mining is all the rage there. Gavin & Osborn were sluicing away in their new diggings, with flattering prospects. They had prospected their bar thoroughly. The bar is of great length, and averages 100 ft. in width. The dirt, from surface to bedrock, contains gold, and some strata prospect from 25 cents to $1 to the pan. Allen and Taylor declare it the richest and most extensive placer mining claim they have seen anywhere in the country.

Mr. Thomas, an old Big Bug miner, who came over from there on Tuesday evening last, confirms the statement of Messrs. Allen and Taylor, and pronounce the bar a big thing. He also informs us that the German Co., and Capt. Lewis were at work in the old Mexican Gulch, making fair wages.

Four hundred feet in the eastern extension of the Vulture lode at Wickenburg, was recently sold for $5,800.

The arastras on Lynx Creek are running and will continue to do so until water gives out.

Work for the present has ceased on the Platanca mine.

The first clean-up made by Jackson & Co., in the Excelsior diggings, paid $15 a day to the hand.

IDAHO.

Owyhee *Avalanche*, August 29th: Late intelligence from Cariboo states that great excitement has been created by the discovery of a large prospect on Peterson Creek.

The Pickens and Edwards tunnel, at Cottonwood, is now in on the ledge 70 feet, where the vein is three feet wide and shows exceedingly rich in silver.

Lewiston *Journal*, July 15th: A new placer mining district has been discovered on the headwaters of the St. Joseph's river, and about eighty miles east of Oro Fino. Quite a number of persons have left this place for the new mines. Three different camps have been formed, either of which will prove good.

Boise *World*, August 26th: Northington and Madden came in from the diggings in Deadwood Basin, last Sunday evening. They report about 60 miners in the district, and they are generally making from wages to good pay. The river diggings have been worked by Highland & Co. for a week, but with what result was not known.

MONTANA.

Helena *Post*, Aug. 28th: We learn that a tributary of Beef Straight Gulch, called American Gulch, has recently been found to contain rich deposits of gold, and that it is now being successfully worked. Although this gulch has been prospected for a number of years, gold has not been found in paying quantities until quite recently.

Wm. Nowlan returned from Cable on Saturday night, bringing with him 359 ozs. of fine gold retort, the result of one week's run in his mill upon Cable ore. The richness of this lead continues unabated.

Mr. David Lusk, just arrived in this city, states that fabulously rich placer mines have been discovered in the Coeur d' Alene Mountains, on the headwaters of the Coeur d' Alene and St. Joseph rivers. These new diggings are 300 miles from here, and are creating an intense excitement, especially on the other side of the range. Mr. Sweeney, formerly of Washington Gulch, has been prospecting in the Coeur d' Alene Mountains for two years, and struck it rich about four weeks ago. His claim is situated on a stream 45 miles in length. From this ground he obtains prospects of $1 to the pan, in a strip of pay gravel four feet deep and 25 ft. in width. Good prospects have been obtained all along the banks of this river, and 200 men are now engaged there opening claims. Sweeney's is the only one upon which a sluice is running. On Booth's River, seven miles southwest of Sweeney's River, prospects of from 25 to 75 cents to the pan are obtained, with a pay streak six feet in depth and 18 inches wide. Upon still another river, from 10 to 15 cents to the pan is obtained. Tributary to all these rivers are numerous gulches, in which good prospects are obtained, in fact, the whole of that section of country seems to be a net work of rich placer mines. There are, in these new diggings, about 700 men, and immense numbers on horseback and on foot, and with every conceivable character of an outfit, are hurrying to them from every point of the compass.

The miners engaged in cleaning bedrock at German Gulch, are taking out big pay, and a lively camp is the consequence.

American Gulch is proving rich in discovery claim.

Capt. Hendric, recently from Rochester district, informs us that the Watseka lead has much improved, with a crevice 5½ ft. wide. He brought in with him 115 ozs. of retort, the result of one week's run in his mill, with eight stamps, on Watseka quartz, the average yield per ton being $40 in currency. The erection of Wamm's 10-stamp mill, also to run on Watseka ore, is progressing rapidly.

Great excitement exists at Beartown and vicinity concerning the new mines in the Coeur d' Alene Mountains. A bar has been discovered there seven miles in length and about 400 feet in width, the dirt upon which, so far as tested, is from 4 to 12 ft. in depth, and prospects from 10 cents to $1.85 cents to the pan. The creek below the bar prospects well.

A correspondent writing from Prairie Bar, says: The bar is about 1¼ miles in length, and from two to three miles in width, with good prospects from the river to the summit. The pay dirt is from 5 to 15 feet in depth, and yields fine gold from the top down. Some 31 claims have been opened, all proving rich. A scarcity of water prevents more than 12 or 15 claims being worked at present. Eighty hydraulics are kept constantly running, and several companies are engaged in ground sluicing on an extensive scale.

The Virginia *Democrat*, says: The Branham lode, at Mill Creek, recently cleaned up retort of the value of $600, or at the rate of $75 per ton for the amount crushed. One week ago Messrs. Hussey, Dahler & Co. received 1,707 ounces of bullion from Argenta, the proceeds of an 18 days' run in the Esler Furnace. The lot is worth $3,000....The miners of Banuack took out $150,000 during the past winter.

Molitor Bros. yesterday smelted over 1,000 ounces of gold dust, worth $19,000 in coin.

NEVADA.

Esmeralda.

Aurora *Union*, Aug. 29th: Mr. Williams, of Hot Springs, brought up on the 27th, from the company's furnaces, 9,215 lbs. of crude bullion. We understand that another party from the springs has 500 lbs. on the road.

Humboldt.

Winnemucca *Argent*, Sept. 3d: J. M. White brought down 141 lbs. of bullion on Tuesday. Late returns shows that it assays from $10 to $12 per pound. Water is gradually failing and the usual weekly amount of rock cannot be crushed. The ore is as rich as ever.

Holt & Elzy have taken the machinery out of the Holt mill here, and it is now being put up within a mile of the mine, and will have a daily working capacity of six tons.

Several men representing capital have lately visited Gold Run district, and all highly estimate the mines.

A correspondent at Battle Mountain writes: Fox & McBeth are pushing things ahead. They have a tunnel in 70 ft., and are working two shifts. They are also employed building a road up to the mine.

There are from 25 to 36 claims located.

The copper ore in this district is as rich as I have seen in any part of the State, and resembles in appearance Walker River and Peavine ores.

Unionville *Register*, Sept. 5th: The latest news from Battle Mountain district, show a healthy state of affairs there. The Little Giant ledge looks better every day. The new mill is drawing rapidly towards completion.

Reese River.

Austin *Reveille*, Aug. 29th: The Combination Co's mill will be closed next Monday. Work is progressing handsomely on Leon & Co., El Dorado South, which is producing an abundance of milling ore.

Sept. 1st: There were shipped during the month of August, through Wells, Fargo & Co's express, 225 bars of bullion, weighing 67,172.13 ozs., of the value of $266,474.

Sept. 2d: Thirteen bars of bullion, of the value of $16,500, were shipped to Boston yesterday by John A. Paxton & Co. They were the product of ore from the Buel North Star mine.

Three bars of bullion, of the value of $2,670 were received to-day at the banking house of John A. Paxton & Co., from the Twin River S. M. Co's mill at Ophir Cañon.

The amount of bullion shipped by the Manhattan Silver Mining Co. for the month of August is $151,538.83.

John A. Paxton & Co. received yesterday five bars of bullion of the value of $4,400, from the Knickerbocker mill at Ione.

Capt. Paine, who has just returned from White Pine, gives the following regarding that district. The mines are looking better than ever, developments showing a richer and better quality of ore yet obtained. The Blue Bell shaft establishes beyond doubt that the Eberhardt and Keystone is a true vein, for therein the south wall of the ledge, well defined, is clearly and distinctly shown.

Sept. 3d: The mines in the Ione district are being worked with a degree of vigor, considering the disadvantages under which the miners of that district are laboring. The Indianapolis and Storm King ledges have been worked since last fall, yielding each an average of 15 tons of ore per week, the first paying over $100 per ton and the latter $150 per ton. The incline of the Indianapolis has reached a depth of 240 feet, and that of the Storm King a depth of 250 feet, and both mines look very well. Besides these several batches of ore have been taken out of the Hermit, Savage and Mountain Brow ledges, all paying handsomely.

Sept. 4th: From 90 to 100 tons of ore has been extracted and are now piled in the ore house at the South American mine, which will pay $200 per ton. The ore will be hauled to the mill next week.

Virginia *Enterprise*, Sept. 4th: Some very rich specimens of ore are brought in from White Pine and other outside districts in that section, by parties who have been rambling and prospecting in that direction. The richest ores of the mines in that part of the State are those of ruby silver. We yesterday saw a large lump of ruby ore nearly the whole of which was so pure that it was quite malleable. It was obtained from a mine somewhere in the vicinity of White Pine, but the exact locality we are unable to learn, the parties prefering not to make it known at present. They say they have $120,000 worth of ore piled up at their lead.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Sept. 2d: Seven hundred and seventy thousand dollars was the total bullion product of the mines of Gold Hill for the past month.

Sept. 3d: The Summit mill will resume work in a day or two. It has been altered and fitted up for working gold quartz exclusively. None of the pans will be used for amalgamating, their place being taken by a string of about 120 sluices, furnished with copper plates or blankets. The mill will start up on ore from the Sacramento mine, Cedar Hill. They have a considerable quantity of this ore on hand, and teams are still engaged in hauling.

The Hale & Norcross Co. have found a fine body of ore in their north drift on the 900-foot level of their mine. It is thought that the ore in the north streak will pay about $60 to the ton. The deposit is 10 or 12 ft. wide, and has been traced for a distance of over 100 feet.

The Alpha Co. have at last reached the point in their mine at which they ceased operations last year. They have a vein of ore some three ft. in width that will pay about $60 per ton. This streak appears to be growing wider as it is sunk upon, and it is thought that it is the upper edge of a large deposit.

Sept. 8th: The Bower's mine, at Gold Hill, so long unproductive, is again beginning to give forth its treasures of silver and gold. Bricks to the value of $6,000 have been extracted from the ores of the mine during the last eight days.

The Kentuck Co. have declared a dividend of $30 per share, payable on the 10th inst.

Gold Hill *News*, Sept. 1st: Two assays of galena ore from the Imperial Consolidated mine, Truckee district, were made in Gold Hill yesterday, one by Ruhling & Co., and the other by Wiegand & Co. The samples assayed were a fair average of six tons which the company is now taking out of its mine, to have smelted at Galena, Washoe County, and yielded at the rate of $236.86 and $205.88 in silver per ton of ore.

Wells, Fargo & Co. shipped from their office in Gold Hill, yesterday, 27 sacks of assayed bullion, weighing 1,925 pounds, and valued at $60,984.59.

Sept. 2d: The Bonner shaft of the Gould & Curry mine has now attained the depth of about 1,050 ft., and at the bottom vein matter is now encountered of a very promising appearance.

There was shipped from Wells, Fargo & Co's Gold Hill office this morning, 12 sacks of bullion, weighing 847 pounds, and of the value of $25,114.78.

NEW MEXICO.

Santa Fe *Gazette*, Aug. 15th: Capt. Santiago L. Hubbell is in the city, and talks most encouragingly of the mines in Magdalena Mountains, Socorro County.

OREGON.

Jacksonville *Sentinel*, Aug. 29th: Dillon and Bowden started on a prospecting expedition to the headwaters of Evan's Creek, on Thursday. They are after the "lost cabin."

Dalles *Mountaineer*, Aug. 21st: Rumor says that some Blue Mountain prospectors have struck rich diggings on Burnt River. Portions of the Cascade Mountains are also full of prospectors.

Portland *Oregonian*, Aug. 22d: Henry Hill, just down from the mines on the McKenzie, reports everything lively. A good prospect for placer diggings has been found on Blue, and Mr. H. thinks there is plenty of good paying ground there.

Branch Roads to the Mines.—The Colorado, Reese River, and Virginia City mines are all to be connected with the main continental road by short branches. Fifteen miles of the road-bed of the Denver Branch of the Pacific Railroad are completed, and the work progresses rapidly toward the Platte. For some reason or other the commencement of actual work on the Virginia City and Truckee Railroad has been deferred, and there is nothing likely to be done during the present season.

Telegraphic Connection with the City of Mexico.—General Escobedo and his soldiers are busily employed on a telegraph line running from the capital to the frontier at Matamoras. Meantime our telegraphs near the Mexican frontier are within short distances of Brownsville, about opposite Matamoras. In a few weeks more there will be a message from Juarez, announcing the event of our being placed in speaking communication with the city of the Montezumas.

Prof. Goldwin Smith, of Oxford University, England, has accepted the professorship of Constitutional History at Cornwall University, Ithica, N. Y.

Mechanical.

Crucible and Furnace Steel.

The following is an extract from an article translated for the *Iron Age*, from a German Mining Journal:

"It was long desirable to dispense with the expensive crucibles in making steel; but it is only a short time since Mons. E. Martin, a Frenchman, after several years experimenting, seems to have succeeded in discovering such a method. Many well-informed men in France build great expectations on it. The furnace employed by Martin in his works at Sireuil, near Angouleme, is a Siemens' reverberatory furnace, with regenerators and a concave bottom. Two thousand kilogrammes of steel is said to be produced in this furnace at every operation, for which eight to twelve hours is required. Martin chiefly manufactures soft steel for gun barrels, which he sells to the government at 90 francs per 100 kilogrammes. According to experiment made with it, this steel is said to be fully equal to the best crucible steel. In consequence of this the French government, shortly previous to the Exposition, ordered 150,000 gun barrels of Martin. In making the steel he employs a mixture of good raw iron, puddle steel or puddle iron, and rich iron ore. According to a report made to the jury, one melting consisted of 1,200 kilogr. gray raw iron, 700 kil. puddle steel, and 146 kil. of Algeriau magnetic iron ore containing 65 per cent. of metal; from this 1,672 kil. of steel and 53 kil. of shavings were obtained in 7¼ hours. On other occasions, 3,350 kil. of raw iron, 53 kil. steel shavings, 1,000 kil. puddle steel, 1,600 kil. puddle iron, 189 kil. Algerian ore were used, which yielded 5,618 kil. of steel; 5,850 kil. of hard coal was required for the operation. The iron is first put into the furnace, and when this is melted the other ingredients are added in smaller quantities. It is computed that the quantity of hard coal required to make 1,000 lbs. of steel is, at the highest figure, 1,000 lbs.; the expenses amount to 150 francs per 1,000 lbs. One furnace is said to outlast 25 meltings, needing only slight repairs in the bottom. The rectangular bowl-like bottom of the furnace is made of raw iron; this is covered with a layer of metal containing a great deal of quartz and very hard of melting, about six centimeters in thickness. In the middle of the opposite side is an opening for tapping the melted steel; on this side the bottom is slightly inclined. During the melting, scoria forms, which protects the steel from the direct influence of the flames. The plate forming the bottom is cooled by means of three blast pipes passing underneath; the inflammable gases and the hot air escape through the vertical pipes; those intended for the escape of gas are nearest the interior of the furnace. Draft generators like those of the crucible furnaces discharge the inflammable gases.

American Rifles and English Tests.—On July 27th, the Berdan rifle was tested at the Springfield Armory. At 300 yards the deviation was 2.93 seconds,—while the English Government standard is 6. At 500 yards it was 6.5; the English standard allows 12. Moreover, only a slight elevation, as compared with that required by English rules, was necessary. Furthermore, the whole 150 shots which were fired, were made without once cleaning the barrel. The *Artisan* says that with regard to the English trials at Woolwich, "it may be briefly stated that of the ninety guns and fifty cartridges presented, none, in all respects, came up to the advertised standard; while the results given by the improved Berdan rifle, in every essential particular, are claimed to exceed the best of them by one-half."

The Thinnest yet.—At the iron works of Messrs. Hallam & Co., an English firm, a sheet of iron was recently rolled, which was only one forty-eight hundredth of an inch in thickness. This beats the specimen produced some time since in this country, upon which a letter was written announcing the name of the works where it was made. That was the one-thousandth of an inch thick. Our American unwillingness to be excelled, will no doubt incite our ironmasters to attend to this matter. *Seventy-two thousand* such plates as the one first mentioned, would make a pile as thick as *one* of those armor plates which are rolled by Brown, of Sheffield,—and which measure 15 inches in thickness!

Scientific Miscellany.

Gas Lamps for Heating Crucibles.—W. P. Dexter, in *Silliman's Journal* for July, describes an improved lamp which he has constructed for the ignition of platinum crucibles in analytical operations. With an ordinary Bunsen burner, the surface of the crucible is more or less acted upon, if in contact with the inner line of the flame. He removes the air tube, and substitutes "a somewhat longer one of glass or iron of about twelve millimeters internal diameter. The gas jet should have a single circular aperture, and be in proper proportion to the diameter of the tube, which may be held in any of the ordinary clamp supports. The tube being raised sufficiently above the jet to allow free entrance of air, and a full stream of gas let on, a 'roaring' flame is produced, of which the interior blue cone is pointed, sharply defined, and extends only about half an inch from the top of the tube. A polished platinum surface is not acted upon by this flame provided it be not brought into contact with the interior cone. In the Bunsen burner, as usually made, the supply of air depends upon the diameter of the tube, the holes at its base being more than sufficient to supply the draught. With the wider tube it is necessary to limit the admission of air by depressing the tube upon the lamp when the force of the gas is diminished. Otherwise the proportion becomes such that an explosive mixture is formed; for this reason it is more convenient to use an arrangement in which the access of air can be regulated by an exterior tube sliding obliquely downward over the air apertures. The gas jet should be on a level with the top of these apertures, which must be much larger than those of the ordinary Bunsen's burner."

Liebig and his Opponents.—In a recent lecture before the Bavarian Academy of Sciences, Baron Liebig alluded to the doctrines which have been advanced by Frankland and others, in regard to the mode in which muscular power is generated. He remarked that these doctrines are based upon imperfect conceptions of the nature of the organic process involved. It was just as impossible, by the combustion of dried muscle, to calculate its efficiency in the living body (the assumption of these physicists), as it was by the combustion of a dried bee to estimate the work which it accomplishes in the flight of many hours, carrying the weight of its own body several miles. The muscle in the living body acts like the apparatus in a watch, which gradually expends the power stored up in it. A freshly severed frog's leg represents an apparatus of this kind, with an escapement, while the newly removed heart of the same animal corresponds to one without escapement; the frog's heart beating for hours just as in the living body, while the frog's leg moves as soon as an irritant sets it for a moment; free from the escapement and if small weights are hung on them, it is possible to obtain work from a pair of severed frog's legs—that is, the weight will again and again be alternately raised to a certain height, without blood or the supply of any kind of nourishment.

Distance-Measuring Telescope. — In order to sight a rifle to the proper elevation, it is necessary to know the distance of the target. *Engineering* describes a telescope, just patented, by which the distance of infantry or cavalry may be calculated instantaneously. It has been approved by the Ordnance Select Committee. The means by which the distance is obtained consist of two wires moved by a disk, on which are divisions showing the distance of the troops according to the aperture between the wires. The motion of the wire is produced by a double eccentric moving round the smaller tube to the telescope.

Zirconia for the Oxy-Hydrogen Light. It has been found that magnesia pencils will be gradually wasted in the intense heat of the burning jet of the mixed gases; hence the necessity for some substance that will resist this heat indefinitely. M. Carou, after various experiments, has adopted the earth Zirconia. A pencil of this substance showed no loss after a month's use. In addition to this, it possesses the further advantage of greater luminosity than magnesia. It is, however, rare and expensive, yet it can be economized by mixing it with magnesia or refractory clay.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might us delay.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:

Saturday Morning, Sept. 12, 1868.

Notices to Correspondents.

H. C., PRESCOTT, A. T.—By two inches of water do you mean to imply, as used in mining phraseology, when applied to what is called "hydraulic mining?" Or do you use it in the scientific mode, of two cubic inches per second, or per minute? Even at the former rate, your spring would only be able to furnish one cubic foot, or seven and a half gallons in fifteen minutes—too small an amount to repay the cost of a water-ram for the purpose you propose; for the distance you name (two hundred yards), and to raise a portion the hight you desire (fifty feet), not more than one-fifth of the power could be expected to be utilized, or one gallon and a half each quarter of an hour.

W. & C., HAVILAH, KERN CO.—We regret that we cannot inform you respecting the cost of ice manufacturing machines; much less than such a one as you seem to require, viz: having a capacity for making one ton of ice every twenty-four hours. Perhaps the articles which have appeared in the MINING AND SCIENTIFIC PRESS of the 21st of September, 1867, page 177, and March 23d, 1867, page 184, may supply you some useful information. A really simple and economical ice manufacturing machine appears to us to be still a desideratum. Of the two articles just noticed, perhaps an adaptation of M. Carrés—the one first alluded to—might be made economically available in your position.

CARBON.—We are quite unable to afford you the needful information respecting the value per ton, of 2,000 pounds, of what you denominate "first-class plumbago." Perhaps no commercial substance varies so much in its price, for there are differences in quality quite unapparent to one not experienced in the material. Even with plumbago of first quality, the value within the last twenty years has greatly depreciated. A considerable quantity of what was supposed by the owner to be good quality plumbago, was shipped from this city to England, some time ago, which, on its arrival, was found to be not worth its freight. Really first quality plumbago still, however, obtains a high price.

N. W., SMARTSVILLE.—The Suez Canal project exhibits signs of failure. The French *Corps Legislatif* has proposed to raise the wind by means of a lottery, with premiums amounting to 1,000,000f; but the question is raised, "Will the Suez Canal pay when it is finished?" Small craft can go through the canal, but commerce has not yet commenced to flow by that channel. The Darien Canal project is now discussed.

RECIPROCITY.—Free trade principles are actual, not speculative in England, as may be inferred from the fact that a newly erected cotton mill at Preston, Lancashire, in that country, was recently supplied with machinery from Belgium. It is also reported that Alexander, of Barcelona, (Spain) is now manufacturing marine engines of several hundred horse-power for a Liverpool firm.

The Hafenegger Powder.

A number of professional and scientific gentlemen went out to Harbor View House, in the vicinity of the Presidio, on Thursday forenoon, by invitation of the Hafenegger Powder Company, for the purpose of witnessing the first public trial of that explosive compound. Ten or a dozen different tests were made, with very satisfactory results.

The Hafenegger powder is named after the inventor, Prof. Joseph Hafenegger, an Austrian by birth, and a jeweler and chemist by profession, who has resided in this country for two years past, but who has devoted the last seven years of his life to patient and dangerous experimenting with explosive compounds, in the hope of discovering such a combination of well-known, inexpensive, and everywhere procurable chemicals, as would obviate the extreme dangers hitherto attending the application of anything else than gunpowder to utilitarian purposes, and at the same time to supersede gunpowder on the score of economy and execution. It is an old problem which has exercised the brains of alchemists and philosophers ever since the dark times away back in the Thirteenth Century, when wise old Bacon wrote mysteriously, in anagrammatic Latin that there was a way by which man could create even thunder and lightning with all the ease of the gods, if he only possessed the knowledge to apply the ingredients. It has been a fascination and an infatuation, this inherent striving of the human intellect to grasp and control powers which are beyond the scope of man's animal sphere, and which would elevate him to the position of a demigod in creation, where he has but to will it and the earth is made to quake, or thunderbolts as terrible as Jove's are instantaneously hurled whithersoever he may direct his displeasure. We may note how man has been made to feel his power, since the control of terrible explosives has been placed into his ruling hand, by Invention; and what an educating influence in the history of civilization the possession of that knowledge has been? But the infernal powers have not surrendered their secrets without causing many sacrifices to be made for man's temerity. Thousands have been blown to atoms by the same forces which the world, through their misfortune, has now learned to command with the utmost confidence and ease.

Prof. Hafenegger has been residing in the sand hills somewhere on the seaward side of one of our hills, where the slumbers of numerous unknowing and unsuspecting neighbors have been frequently disturbed by earthquakes that literally changed the contour of the hills, and which, for unaccountable reasons, happened always in the night time. To them, however, the master of the earthquakes was kind, for nobody's person or premises was ever known to be injured; and the most strange phenomenon observable was merely the extraordinary tumbling about of the hills, as discovered by the earliest risers in the morning.

The result is the combination sought for—possessing all the qualities which could satisfy the inventor of having achieved a complete success; and a desire to convince others besides the capitalists who have taken the business in hand with liberal energy, of the superior powers and increased safety and certainty of the new powder, was the occasion for an excursion to Strawberry Island and the trials and comparisons that were there made. Strictly speaking, however, the exhibition was gotten up for the edification and information of a committee of the Mechanics' Institute Fair, where the subdivision of explosives is embraced in Class V. There were other gentlemen in the company, having some special knowledge of the subject to be experimented upon; amongst them, Melville Attwood, M.E.; Capt. Tuttle, formerly of the U. S. Army; a representative of the Santa Cruz Powder Company, whose name we did not learn; Mr. Hallidie the President of the Mechanics' Institute; Mr. Eckart, of the Union Iron Works, etc. Being so near the close of the Fair, the time did not allow of getting up a very thorough exhibition to show the effects of the powder on various kinds of materials; but the committee having been sufficiently enlightened as to the nature and claims of the new powder, a more thorough exhibition is proposed by the company at a later day, when engineers and critical observers will be furnished with every facility to arrive at a satisfactory conclusion.

Prof. Hafenegger has 15 different varieties of this new powder; one of the two kinds tried on Thursday being proved, by actual experiments, to have five hundred and sixty times the strength of common powder. He says he has also another compound, which he has made and experimented with in private, that is still more powerful than any he proposes to manufacture. Owing to the great danger experienced in the making and use of this last mentioned article, he has given up farther experiments with it. A weaker kind is used for gunnery and fire arms. The first mentioned powder is grey in color, and is not explosive until saturated with a liquid which is kept separately, and is equally harmless until brought into proper combination. The weaker powder is also grey, but requires no liquid saturation, and is used exactly like the ordinary gunpowder, over which it has the advantage of not being injured by moisture. For blasting, a self-igniting match consisting of a piece of ordinary paper on which a few drops of liquid are poured, also invented by Prof. Hafenegger, is used. The experiments made were as follows:

1. The first trial was with twelve ounces of the strongest powder, the place selected being a well which had been filled up to within five or six feet of the surface. An iron ring about a foot in diameter was placed on a solid wood foundation in the bottom of the well. On this was placed a mass of iron an inch and a half in thickness, composed of four slabs of wrought iron, each three-eighths of an inch thick, which were firmly riveted together. A mass of solid copper weighing one hundred and twenty pounds, a foot in width and seven inches in height, and having a hole two inches in diameter bored completely through it, was placed on the iron plate. The powder was now put into the hole in the lump of copper, and the fluid, which makes the powder, was poured into the cavity. A cannon ball weighing one hundred and forty pounds was now placed over the hole in the copper, and the blast was ready for explosion. The fuse used was of the ordinary kind, having a paper wrapped around the end to be ignited, to which the self-igniting liquid was applied. This liquid will, according to the strength applied, ignite in from one to five minutes, or a longer time if desired, after it is exposed to the air. The blast exploded with a sharp report, resembling the bursting of a thunderbolt close by. The cannon ball was thrown from twenty-five to thirty feet above the surface, and the bags of sand, piled around the mouth of the aperture to keep pieces from flying, were raised from the boards on which they were laid, and fell into the hole. It was found that the iron slab was indented to the depth of one and a half inches, and the plates cracked in several places. The upper half of the lump of copper was completely blown off, leaving the remaining portion jagged and cracked. There would probably have been greater destruction had the lump of copper been cut so as to have laid smooth on the plate of iron. A similar experiment was tried the day previous, in the presence of the Directors of the Company with much better results. The wrought iron cylinder used to hold the powder was blown to atoms, and a large ragged hole was torn through the center of the iron plates used. All of the pieces left from these two trials have been taken to the Mechanics' Fair, where they will remain on exhibition.

2. A charge of one-eighth of an ounce was placed in a small excavation in a solid block of iron, and covered by a cannon ball weighing ten pounds. The explosion threw the ball into the air about 25 feet.

3. One ounce of the mixture was placed in a hole 13 inches deep in a solid iron and covered by a tinner's anvil weighing seven pounds. The force of the explosion threw the anvil fully 1,100 feet high, the time of the ascent and descent being kept by one of the party. The steel face of the anvil was indented by the force of the explosion. It was found that common powder, placed in the same cavities used in the above experiment, did not even raise the weights. The anvil is also on exhibition in the Fair.

4. Six grains were now placed in an excavation, in the iron, which was one-half of an inch in diameter and one inch deep, and were covered by an anvil weighing 5¼ pounds. On being fired, the weight was thrown into the air *six feet*. Seven ounces of common powder (which is in the proportion of 1 to 560,) placed in a large hole, did not throw down the iron.

5. One-half of an ounce of the powder was placed in a druggist's small iron mortar and covered by a common beer keg. The force of the explosion threw the keg into the air about 35 feet.

6. Thirty ounces, or 2½ pounds of common powder were exploded in the same manner, and the keg was only raised about a foot.

7. Two and a half ounces of the weaker or dry Hafenegger powder were now placed in the mortar and covered by a barrel weighing 76 pounds. The barrel was thrown into the air between 50 and 60 feet.

As to relative strength, gun cotton is about 12 times as effective as ordinary gunpowder; nitro-glycerine is 16 times; the weakest Hafenegger powder, 20 times, and the strongest Hafenegger powder used is 590 times as strong as ordinary gunpowder. In general, the latter is estimated to do ten times the work of ordinary gunpowder. It can be sold at from 60 to 70 cents a pound.

The special claims in favor of the powder are: first, its cheapness; second, its strength,—expansive, lifting and crushing; third, the ease and simplicity of its manufacture, no heavy and expensive machinery, and no extraordinary skill being required, An ordinary knowledge of chemistry is sufficient to enable a person to prepare the original ingredients, and but little more than a mechanical knowledge is requisite to complete the article. The raw materials can be obtained in any part of the world. Fourth, safety of transportation and storage; fifth, safety in use; sixth, explosibility by ordinary means, as by fire-fuse when mixed.

The advantages claimed for the self-igniting match are: first, its safety for blasting under all circumstances, there being no fire about, and no danger of a too hasty burning of the fuse; second, certainty of ignition; third, cheapness; fourth, portability.

Patents have been applied for through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, to cover every civilized country in the world. This, of itself, is significant, as showing the confidence felt by the capitalists who have undertaken the manufacture of the Hafenegger powder, in its certain success and universal application. It is the first instance in the history of California inventions where the necessary steps have been taken for the procurance of patents for the whole world.

DAILY FAIR PRESS.—Copies of this sheet, bound and complete, and embracing reports of all the important incidents at the Fair, as well as full descriptions of articles on exhibition, can be procured of the publisher after the Fair closes. The volume will form a full and complete history of the Exhibition, and will be very valuable for preservation and future reference. Exhibitors who advertise and receive special notices in the paper, by procuring the volume, can enjoy the benefit of the same for their private libraries. The pleasure of the perusal of such a volume, in after times, will be worth many times its cost.

A LABOR EXCHANGE AT NEW YORK has been opened in Castle Garden. During 12 days there were applications for laborers, 2,012; for employment, 1,804; average orders per day, 168; average applications, 150; average wages per month, for men, $25; for women, $9.

Next Meeting of the American Association for the Advancement of Science.

At the recent meeting of the American Scientific Association at Chicago, a committee was appointed to choose a place of meeting for next year. Professor William P. Blake, of California, suggested that the next meeting should be held in the city of San Francisco, California. He said, in making the suggestion, that he did not assume to be authorized to speak for the people of California, but he ventured to say that if the Association would honor the Pacific Coast with its presence, it would be enthusiastically received by the citizens of California, and with a generous hospitality equal to that heretofore extended to the Association, and even equal to that experienced in Chicago. He wished the members of the Association to know from experience, the high appreciation which the people of the Pacific Coast have for science. The probable early completion of the great railway across the continent, at about the time of the next meeting, would afford a fitting opportunity to visit that remote portion of the United States, and he did not doubt that the liberal and enlightened men who control the roads, in the West and the East, would extend all facilities to the members for the transit.

The suggestion was received with applause, and Dr. B. A. Gould, the President, remarked that if the kindness and hospitality received by the Association increased as the square of the distance westward, the members would have a pretty good time of it.

Although the proposition met with great favor, the fear that the Pacific Railway might not be completed in season, and the absence of any direct invitation to visit San Francisco, while the city of Salem, Mass., wished to receive the Association there, caused the committee to recommend Salem as the next place of meeting, and this was adopted. The meeting will be held during the last week in August, so as to give the astronomers an opportunity to see the great solar eclipse, and then report the results at the meeting.

OLYMPIC CLUB.—The following gentlemen were elected last night as officers of this Club for the ensuing year: For President, John McComb; for Vice-President, T. R. Butler; for Treasurer, H. B. Russ; for Secretary, D. A. Carpenter; for Leader, W. S. Lawton; for Directors—C. A. Bennett, G. H. Strong, G. W. Ramage, and A. A. Son.

CHICK & BROOKS, at No. 834 Market street, are active dealers in stoves, hardware, lamps, crockery, glass and plated ware, which they offer to sell very reasonably. They keep well up with the times, and will give you the latest improvements in their line of goods at just as low prices as you would pay for an inferior article elsewhere.

WELL APPOINTED.—Mr. Winship, who has so thoroughly and systematically superintended the machinery department of the Mechanics' Fair, has received a similar appointment at the hands of the Managers of the State Fair, which opens next Wednesday, at Sacramento.

THE handsome little model exhibited at our stand in the Pavilion, represents the design of the steam yacht, for which Detrick & Eckart's balanced oscillating engine is intended. Both are neat little affairs, well designed for each other, and a credit to the enterprising inventors.

"SWEETT & GANSBY, house and sign painters, oil and color merchants," are the words upon an unassuming but well executed sign card in the Pavilion, although it but partially advertises to strangers this respectable firm.

CONUNDRUM.—What is the best thing to improve the eyesight? Give it up. Muller's Brazilian Pebble Spectacles, 205 Montgomery street. *

Small's Improved Planer.

In one corner of the machinery department, next to the glass blowers, is located an unpretending machine, which is apt to be passed by, as too common in appearance to be worthy of examination. And yet it represents the real spirit of California invention, and the progress which is placing our State in the front ranks in the march of mechanical progress.

It is only recently that Isaac H. Small, machinist, corner of Market and Beale streets, commenced making a specialty of wood-working machinery, and now he is turning out full size planing machines, which are an improvement on the Woodworth planer, and which give much better satisfaction to those who have used them. His planer at the Fair, to which we allude, is adapted to planing boards or timber, from ¼ of an inch in thickness and one in width, to 10 inches thickness and 24 inches wide. It is also suited to making moldings of various forms of patterns, giving it a wider range of work than any other machine of this class. It has a wrought iron slotted head, which is adjustable to a larger variety of different size and style of tools. The rolls rise higher, quicker, and more easily than in the common planer. Mr. Small's experience gives him the advantage of enabling him to suit his machines to the quality of wood to be operated upon, and the class of work required to be done on this coast.

It is a correct policy that home manufactures should be patronised, even at a seeming sacrifice to the purchaser; but when a better home article is offered than any imported, and at the same price, or for less, it is worse than bad in practice, and short-sighted in principle, to favor the latter. These machines are sold for $200 less than those imported, and are warranted. The weight is 4,500 pounds.

A PRACTICAL GUIDE FOR THE PERFUMER, being a new treatise on perfumery the most favorable to beauty without being injurious to the health; comprising a description of the substances used in perfumery and the formulæ of more than one thousand preparations, such as cosmetics, perfumed oils, both powders, waters, extracts, tinctures, infusions, spirits, etc.; by Prof. H. Dussance, chemist. A. Roman & Co.

Perfumery has advanced, in modern times, to a prominent position amongst the arts. Organic chemistry has lifted it out of charletanry, and placed it amongst the prominent and useful developments of civilization. How characteristic and vivid are the associations frequently brought back to us by some long forgotten perfume, which reminds us unawares of a train of occurrences and feelings of the past. Not only the perfumer and manufacturer will find such a book as this valuable, but the student, and producer, in a new country like ours, may derive hints of knowledge whose power shall consist in solid financial profit.

THE FIRST IRON produced on the Pacific Slope, was made at Oswego, Oregon, by the Oregon Iron Company, who are now successfully manufacturing and shipping iron. These works are the first representatives of a great interest which is bound to develop on this coast. A few samples of this ore, and manufactured iron, are exhibited on our desk in the Pavilion. Another season we hope to see them fully represented.

INGENIOUS AND VALUABLE.—B. F. Barker's patent concealed door spring and double reversible butt are two as meritorious inventions as any exhibited in the Fair. Both emanated from the active brains of an old Californian, who we hope will, ere long, be richly rewarded—as he deserves to be. These inventions will be seen in the hardware section of the Pavilion.

SAVING OF PYRITES AND RUSTY GOLD.—Allen Oliver, Esq., of Jamestown, Tuolumne County, has invented a machine for saving sulphurets, and rusty gold that will not amalgamate. A model has been constructed and is said to work "to a charm."

CITY AND COUNTRY REAL ESTATE.—The activity which prevailed in San Francisco real estate transactions a few months ago has subsided, and speculation has transferred itself to the purchase of Government lands in the interior, and Mexican ranches in the coast ranges and southern counties.

WANTED—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

SAVE YOUR TEETH.—Drs. Jossup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instantly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 652 Market street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

Support Home Manufactures.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
HOSE AND TAPE FUSE,
A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

JAPANESE METHOD OF MINING COAL.—Mr. Locock, in a recent letter to the British Foreign Office says: "I had an opportunity while there (mines near Hisgo, Japan,) of visiting the works—if, indeed, they deserve the name—which have been undertaken for procuring the coal. Here and there, where the coal or shale which had lain over it had been seen cropping out from the hillside a horizontal passage had been run in, never more than twenty-five feet, and often only ten or twelve feet in length. In some of these burrows two or three men, cronched to the ground, were at work picking away at the sides with pointed hammers, and sorting each little piece of coal with their hands before throwing it into one heap or another, according to its quality. The Japanese Government are not insensible to the advantages to be derived from a more scientific working of the coal of Hisgo, and it is not impossible we may soon see a regular coal mine opened, that is worked by European machinery."

EARTHQUAKE ALARM.—The Japanese have discovered, it is said, that a few seconds previous to an earthquake the magnet temporarily loses its power. They have ingeniously constructed a light frame supporting a horse-shoe magnet, beneath which is a cup of bell-metal; to the armature is attached a weight, so that upon the magnet becoming paralyzed the weight drops, and, striking the cup, gives the alarm. Every one in the house then seeks the open air for safety.

HISTORICAL.—The treaty with China has been duly ratified. The two friendly nations lie on opposite shores of the Pacific, one is the youngest and most powerful, the other the oldest and most populous, in the world.

RAILROAD BUILDING ACTIVITY.—The San José road extension to Gilroy, thirty miles in length, will be completed, it is promised, by December next. This road is prosperous, and the country and towns through which it passes are in a highly flourishing condition.

Subscriptions are being received for the building of a railroad from Anaheim to Buenaventuras, in Los Angeles County, a distance of nearly 50 miles.

The railroad from Vallejo to Sacramento is now completed for 46 miles, to Davisville, which is within 14 miles of Sacramento. The portion yet to be built, will be on piles, because the country is subject to overflow in winter, to depths of three to fifteen feet.

Several railroads are under active headway in Napa, Solano and Marin counties. The commencement of work on the junction road from Harrisburg to Suscol, to connect the Napa Valley with the California Pacific road, is announced; and a contract has been made for the construction of a road from Davisville to Woodland this year.

A contract has been made for grading ten miles of the San Francisco and Humboldt Bay Railroad, eastward from Petaluma, before the 1st of December, but the Superintendent expresses the belief that the entire distance to Santa Rosa, sixteen miles, can be completed before that time. Arrangements are being made to purchase forty miles of iron.

The Stockton *Gazette* says that a paper is being circulated among the citizens for subscriptions to a railroad from Stockton to Paradise Valley. It will be the first step toward opening up the Tulare region, and will pay from the start.

HOW TO ACQUIRE AND ENLIST CAPITAL.—Friedley, the "retired merchant," says: "Capital is a general term for the accumulated stock of former labor. Its father is Labor and its mother Economy. The economy that leads to wealth implies a judicious use and profitable investment of savings. The rewards of labor, and the faculty for the acquisition of capital, are increased by the possession of some peculiar knowledge or skill. A man's pecuniary value may be said to augment in exact proportion to the amount of his effective intelligence, superadded to ordinary physical power. The demand for educated labor, in progressive countries, so far exceeds the supply that it may, to a certain extent, dictate its rewards. Men, animals and machines, are everywhere working fruitlessly or unprofitably for want of suitable persons to direct their movements; enterprises of the first magnitude languish for want of competent managers; and regions where nature has been most bounteous in her gifts are yet comparatively a wilderness, because the arts and mechanism of civilization have not been introduced. The accumulation of capital may be accelerated by *associating with personal labor some responsibility*. Capitalists, in general, are timid, and desire to protect themselves against extraordinary expenses. It is in the nature of capital to surround itself with safeguards, and it willingly pays a premium for guarantees."

STEAM CARS FOR STREET RAILWAYS.—The Brooklyn City Railroad Company have brought out a car worked by a steam engine, the furnace of which is heated with kerosene. The fire is started by a small bed of anthracite coal, which lasts all day without replenishing, as it is used merely to act as a sort of wick for the kerosene oil, which is the real fuel. There is a tank of kerosene at the point on the platform furthest from the fire. From this a small pipe leads to the fire, and a small quantity of kerosene is squirted in occasionally. No cinders or smoke are generated, but sufficient heat is evolved, the patentee claims, to keep up steam constantly in the engine with a very trifling expenditure of oil. The *Artisan* says that limited trials of this dummy have been successful.

DECISIONS WITH REGARD TO PREMIUMS.—The reports of the committees in classes 13, 16, sec. 1, 17, 22, 24, 29 and 30, sec. 1 and sec. 2, have been handed in at the Directors' room in the Pavilion, and are placed in file to remain with such as may continue to come in till Friday evening, when the seals will be broken and results announced.

The awards of premiums will be formally and publically made in the Pavilion on Saturday, at 7 o'clock P.M., and will occupy a good portion of the evening. Probably a short speech will accompany the delivery of the Institute Medal.

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of smelling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolver, 12 a, 9 a, and 7 a, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

SPECIALTIES.

PRICE AND GUARANTEE.

The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Bags and Valises, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of piece goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.

STYLES.

Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.

GOODS MADE TO ORDER.

For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc. made to order at short notice.

COUNTRY ORDERS.

Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

SAN FRANCISCO

HYGEIAN HOME WATER CURE.

No. 637 California street, opposite St. Mary's Cathedral.

WE HAVE NOW THE MOST EXTENSIVE AND COMplete Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest pursuance of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a Home combining all the Hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the prices for gentlemen to $20 per month; to ladies from $15 to $20 per week for board and treatment.

FARLOW J. SMITH, M. D.,
Physician and Surgeon.

SAN FRANCISCO

Pioneer Screen Works,

JOHN W. QUICK, Manufacturer,

Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.

Screen Punching in all its branches, at rates reduced from 25 to 40 per cent. less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.

N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

Social Law and Rank.

The Pavilion is a great catholic church, where we are all devotees, on a common footing, at that shrine of necessity which is called Industry, and we are all dutiful subjects to social law, wherein the ladies are the law-givers though in a roundabout way. There no aristocracy is to be seen, no privileged class taking rank above another, nobody so great a fool as to permit others to suspect that he feels himself in any manner above the grand level of the educated mass. There is not a coxcomb, nor a flirt, nor an empty-headed rich man or his wife, nor a fledgeling collegian with his head full of impractical theorems and vanities, in San Francisco, or on the coast, but recognizes, the moment he passes the door-keeper, the existence of this spirit of democracy, or he suffers sad damage in a thousand critical eyes. No worthless Prince comes here to be toadied; no lordling, who has attained power and the outward manner which soon follows consciousness of its possession, by unjust favor of law—instead of by proud, democratic, manly endeavor—expecting, though unobtrusively, if he be a gentleman, that others shall step aside for him. No "F. N.'s," nor owners of Spanish leagues, can be distinguished here from an exhibitor of a hydraulic nozzle. In short, while there is not wanting a great deal of superior mental and physical material, there could not be found in all the world a better representation of an intelligent republican community than that which we witness in the nightly frequenters of the Institute Pavilion.

The social lines are not yet drawn with distinctness in California, and social law, if measurably defined, perhaps has inefficient executors. But social law, with its attending ostracism, is an inherent necessity, and some kind of separation into classes is inevitable in the nature of man, as is sufficiently evidenced in history.

The elements of social rank and of California society of the future, are all exhibited openly and unrestrainedly at the Fair, and that is the reason why you, reader—though you were not aware of it—have been coming here night after night and oking at the people, instead of looking at inanimate things and machines.

MECHANICS' INSTITUTE IN OAKLAND.—The eight-hour league at Oakland has resolved itself into a Mechanics' Institute, similar to that of San Francisco, and the following gentlemen were elected as officers *pro tem:* President, C. A. Wetmore; Secretary, W. D. Harwood; Treasurer, W. B. Hardy. The Committee on Organization and Arrangements is composed of A. C. Henry, W. Prosser, Jas. N. Olney, J. Anderson, C. L. Lucas, D. G. Barnes, F. L. Taylor, J. S. Emery, J. H. Ellis, J. J. McCready, R. N. Murray, E. L. Wetmore, C. B. Rutherford, V. L. Eastland. As a committee to solicit members and donations, the following names were nominated and elected: F. Cook, J. A. Mngagnos, W. B. Bagley, S. F. Mead, J. W. Hand, C. B. Rutherford, W. B. Hardy, J. S. Emery, Dr. E. H. Pardee and S. Hirschberg.

ALCOHOL FROM WOOD.—In the process of making paper from wood, round disks of wood are first subjected to the action of hydrochloric acid to dissolve out the spongy cellulose. This latter has, until lately, been a waste product, but is now converted into alcohol in this way. The wood is boiled for twelve hours in hydrochloric acid, diluted with ten times its volume of water. The acid liquid, which is charged with grape sugar formed from the spongy cellulose, is then withdrawn, the excess of acid saturated with lime or chalk, and a small quantity of yeast is added, the temperature being kept at about 68° Fah. Fermentation soon ensues, and when bubbles of carbonic acid gas are no longer evolved, the liquid is distilled to obtain the alcohol. *Druggist's Circular,*

SOCIETY OF ENGINEERS.—A new society has been formed at New York, composed of practical and scientific engineers, which will hold stated meetings for discussion at Cooper Institute. President, J. A. Whitney, of the *Artisan;* Corresponding Secretary, J. B. Lyman, of the *World.*

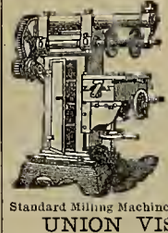
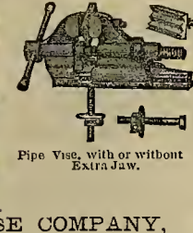
Pump Manufactory

M. D. LASSWELL,
No. 747 Mission Street, bet. Third and Fourth
PATENT PUMP
And Patent Water Closet Manufactory.



House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Rosos and Rose Stands, and all kinds of Brass Cocks. Force, Lift and suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country. I have now on exhibition at the Mechanics' Fair thirteen Pumps in brass and iron, all of my own make, which can be seen at my place after the close of the Fair.



I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over my Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom. Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

Progress.

Six years ago the author of "Resources of California" wrote: "We now import all our hardware, glassware, porcelain, stationery, silks, cottons, fine woolen goods, and nearly all our clothing, boots, shoes, and fine furniture, and many of our agricultural implements, mechanical tools, wagons and carriages." * * "We have no secondary coal in the State, and cannot expect to smelt iron ore, or to make cutlery or fine articles of hardware. Some cotton is produced on the shores of China and is now shipped to England; perhaps we may at some future day be able to import it raw and manufacture it here, but of this there is no certainty. Now, coal, iron and cotton are the raw materials for a large share of the most profitable manufactures of our age." * * "There are two great difficulties in the way of the productive industry of California, the high prices of labor and the high rates of interest."

Those who have attended the Mechanics' Institute Fair of 1868—or read the MINING AND SCIENTIFIC PRESS—will note for themselves the changes that have taken place within these few years, being sufficiently remarkable and obvious not to require any comment. The times have manifestly changed, and are changing still; but like the canoeman who is running the rapids, we see only the whirl of elements that are moving with us, and we do not realize the exciting precipitancy and grandeur of the situation, as it is witnessed breathlessly by the occupant of a stationary standpoint on shore.

THE NEW ATLANTIC CABLE TO BREST.—The *Moniteur* has confirmed in an official manner the concession of the right of laying down a submarine telegraph cable between Brest and the United States, and a corresponding concession has been granted by the State of New York. The cable will be laid direct from Brest to New York city. This concession is understood to be an exclusive one—on the French side, at any rate—for twenty years.

The grounds upon which the projectors have found favor with the French and New York State Governments has been, chiefly, that the proposed cable will obviate the circuity and delay incident to the present line, and will also lessen the existing liability to casualties. By the only route we now have, not less than four submarine cables have to be employed, while the electric fluid has to perform four land journeys also before a message can be sent from the continent of Europe to New York.

Ocean telegraphy has been carried to such perfection that there is more fear of mishap by land than by sea; and, in point of fact, during the last two winters, when we have several times been alarmed by the stoppage of messages, the explanation has in each case been that storms had blown down the land telegraphs, sometimes on the American mainland. As the capital it will represent will, it is stated, be only £1,000,000, and as the working expenses, with only two stations (at Brest and at New York), ought to be very small, it is probable that this project will bring the luxury of telegraphing across the Atlantic within the reach of persons of very moderate means. It is understood that the new Atlantic Cable will be ready for laying next June.

THE best "signs of the times" are those made by Mr. F. Mansell, No. 422 California street. He is an adept at sign painting, having had large experience. The MINING AND SCIENTIFIC PRESS office has been supplied with and embellished by Mansell's fine touches for the last five years, and we can say his work wears well to the eye and in matter of fact.

ROCKY MOUNTAIN AURIFEROUS REGULUS. About 30 tons of copper regulus were delivered at New York, recently, without transfer of cars, from Omaha, in twelve days, being brought from near the mines of the Boston and Colorado Mining Company, by the Pacific road. It was transhipped from New York to Wales, where the regulus will be made to yield, about 80 or 85 per cent. of pure copper.

ACADEMY OF SCIENCES.—The proceedings of the California Academy of Sciences, as published in the MINING AND SCIENTIFIC PRESS, are regularly quoted by many of the English and Continental scientific and technical journals. There has been no meeting for several weeks.

Art Photography.

The exhibition of photographs by Bradley & Rulofson, is worthy of study in a different light from most ordinary productions of the photographic studio. As everybody will have noticed, there is a successful combination accomplished of two photographic pictures in one, whereby the individuals photographed are placed into a different scene from the surroundings of the gallery. This is the advancement of photography as an art, which entitles it to our respect, since it presents additional means for instruction, and the gratification of a refined taste. It is a combination of higher art with photography.

Some of the marine pictures exhibited are remarkably successful. A fine sea piece from some master of marine effects is taken, and the sitter is placed on board of a yacht with all the apparent results of an instantaneous photograph taken from nature, where the artist must have been a sea gull to have obtained his view. In one of the pictures a sturdy old Commodore is brought ashore in view of Yerba Buena,—a real photograph of the water and island and some ships,—by one of Bradley & Rulofson's operators in their own boat; that portion of the picture having been taken in the gallery. Some of the mystic photographs also evince much ingenuity and taste.

The display of Bradley & Rulofson has always been a leading one at previous Fairs in that department, and they have invariably been amongst the first to introduce new and attractive features to meet the desires and tastes of the public. Mr. Rulofson especially, has made the artistic applications of photography a study; and success in obtaining some special or truthful effect, supposed to be beyond the skill of the ordinary photographer, appears to afford him all the satisfaction of the painter in oil, when he has placed an original idea upon canvas.

TOOL MAKING.—Amongst the constantly increasing number of manufacturers of superior tools on our coast, the establishment of Carl Hinz is represented in the exhibition by a case of very creditable molding, carving and turning tools, which the visitor would overlook, unless his attention were specially called to them. The method of using these molding tools by machinery is peculiar. Two chisels of similar shape, made to cut the form of molding desired, are attached to an upright, rapidly revolving shaft, and the wood is shoved alongside. The chisels cut successively, with such rapidity as to give the molding a smooth surface.

RETURNED.—Mr. H. T. Graves, proprietor of the California Wire Works, who has just returned from the East (where he has been for several months preparing to enlarge his stock) was serenaded on the evening of the 3d, by a number of his friends, at his residence on Mason street. Mr. Graves is one of our most enterprising manufacturers, and we are glad to note his arrival. The exhibition at the Fair from his house this year, we have already noticed as a splendid affair, but next year we shall doubtless witness new manufactures and a larger display.

CAUTION.—It would be well for those in the country who are afflicted with diseases and nervous difficulties, when they visit the city to find a doctor, to understand that there are more than one or two physicians who are successful in curing diseases if they do not belong to the Medical Institutes; and probably there would be a saving of time and money to try some one of the reformed practice before being burned, blistered and calomized; and that the *Electro-Magnetic* treatment, in some of the several forms, vapor baths, etc., is the safest, surest and best method, as applied by Dr. Benton, at Congress Hall Building, *Bush street*, San Francisco. *

PLANTATION BITTERS combine rare medicinal virtues with a delicious aroma, and a flavor grateful to the palate. It is purely vegetable, and in its composition all the requisites of science have been complied with. It is suitable for all ages and sexes. It is gentle, stimulating and soothing. All dyspeptic disorders are cured by it, and it repairs and restores nature's wasted powers. PLANTATION BITTERS are increasing daily in favor with all classes. It relieves suffering, renders life a luxury, brightens the present, and throws a hopeful light on the future. *

THE miniature garden of Mr. Woodward's, which has attracted so much attention at the Fair, will doubtless induce a large number to visit his beautiful Gardens at the corner of Valencia and Fourteenth streets, and take a view of their wonders. *

LIFE AMONG THE MORMONS AND INDIANS. This is the title of a very simple and plainly told tale, embracing the author's experience and observations during a period of eight years in Utah and along the stations of the overland stage route. The events and phases of life and character are described as recent, and if true, the book may be taken as the best available publication to convey an idea of the existing state of things up to the present time, along the line of travel where the great continental railroad will, with the present blessed year of 1868, bring on a new order of things. The author is an Englishman, who lived among the Mormons, and was evidently considered one himself; he escaped from Salt Lake finally, at the risk of his life. A great recommendation to the book is that there is no attempt made either at fine writing or at telling startling things. Facts and incidents very interesting to those who have made the overland trip, are told plainly. Published by J. A. Wilson, Sacramento; pp. 146. Price 50 cents.

AN AMERICAN INVENTION ADOPTED BY ALL NATIONS.—One of the greatest and most beneficial inventions of the nineteenth century—an invention which has had no rival for more than thirty years—an invention which has received the highest premiums at all the leading exhibitions of mechanical art throughout the United States and in foreign countries (including the great "Exposition Universelle," 1867, of Paris)—an invention which Great Britain, China and the world at large acknowledge as THE STANDARD. We refer to the Fairbanks Standard Scales, invented by Thaddeus Fairbanks, of St. Johnsbury, Vt., the present proprietor and manufacturer.

G. REUBEN, practical printer and jeweler, exhibits a sancepan cover which allows the steam to escape, but prevents anything from falling into the pan while cooking. It possesses other improvements "too numerous to mention." Patent applied for.

New Mining Advertisements.

Chiplonean Mining Company—District of Cres, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board Trustees of said Company, held on the seventh day of September, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street, up-stairs.

Any stock upon which said assessment shall remain unpaid on the ninth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. se12

Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1867, an assessment of two ($2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 40 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary.

Office, Room 40 Merchants' Exchange Building, California street, San Francisco, Cal. sep12

Nevada County Gold Mining Company, Nevada County, California.

Notice is hereby given to the Stockholders of the Nevada County Gold Mining Company, that a meeting will be held at the office of the Company, No. 9 Merchants' Exchange, California street, San Francisco, on MONDAY, the fifth day of October, 1868, at the hour of 12 o'clock, noon, for the purpose of electing officers, and the transaction of such other business as shall come before the meeting.

[Signed] E. S. CURTIS, } Trustees and
B. WELLMAN, } Stockholders.
WM. NEWTON MEEKS, } Stockholders.
CHAS. DALSEY,
San Francisco, Sept. 9th, 1868. sep13

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the seventh day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E Halphen	45	49	$98 00

And in accordance with law, and an order of the Board of Trustees, made on the seventh day of August, 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salerooms of J. Middleton & Son, 310 Montgomery street, San Francisco, on the twenty-eighth day of September, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. sep12

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

Mining Notices--Continued.

Banker Hill Quartz Mining Company. Location of Works: Near Amador, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of May, 1868, an assessment (No. 8) of ten dollars ($10) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to DANIEL PALMER, No. 134 State street, Boston, Massachusetts.

And whereas said assessment was not duly advertised as required by law, and as contemplated by the resolution making the levy, at a subsequent meeting of the Board of Trustees, held September 2d, 1868, it was resolved, that—

Any stock upon which said assessment shall remain unpaid on the sixth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WALES L. PALMER, Secretary.

Office, No. 19 First street, San Francisco, California. sep5

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of August, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty third day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twelfth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. au22

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of of August, 1868, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventh day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. au29

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everre-quired repairs. The constant and increasing demaud for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thcuce it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfeetly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

3v13f SAN FRANCISCO.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanliko manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

3v13-1y Stove Store. No. 125 Clay street, below Davis.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Pow ers for one or four horses, Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constautly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are pertectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

To Inventors.

The undersigned is now prepared to assist inventors or others by manufacturing Models for the Patent Office, large working Machines or Devices of every description, in Metal or Wood, in the most workmanlike manner and at reasonable rates. Also, Patterns tor Iron and Brass Work and all kinds of Machinery.

Having had ten years practical experience in this city, parties can be assured all work entrusted to me will be executed in a prompt and satisfactory manner. Power will be granted to parties wishing to test or experiment with machinery.

☞Full files of the Patent Office Reports for the use of patrons. **J. H. CULVER,**

3v17-3m **20** Fremont street, over Phœnix Iron Works.

GLASGOW
Iron and Metal Importing Company

Nos. 25 and 27 Fremont street,

SAN FRANCISCO,

Keep constantly on hand a large stock of best Bar and Bundle Iron, Boiler Tubes, Plate and Sheet Iron, Gas and Water Pipe, Anvils, Cast Steel, Gas and Water Fittings, which they offer to the trade on liberal terms.

21v16-3m W. McCRINDLE, Manage.

SWYNEY & SMITH,
MARINE ENGINEERS,

63 Montgomery Block, San Francisco,

Are prepared to furnish General Plans, Specifications, and full detail Drawings for propeller or side-wheel steamers, also for iron vessels of all classes, engines, boilers, etc. Also for locomotive or stationary engines, and machinery in general. An experience of over twenty years in this profession enables us to furnish correct drawings and guarantee results.

JOHN SWYNEY. 8v17-tf DAVID R. SMITH.

Fire, Hose and Machine Belting.

THE SUBSCRIBER CONTINUES TO MANUFACTURE Oak Tanned Leather Fire Hose, warranted superior to Eastern Hose, manufactured at the Sixth Street Tannery, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **$600**

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... **850**

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BROOIE'S PATENT IMPROVED CERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Miniag and Scientific Pross," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHINO.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

HEAT AND MOISTURE IN THE DEEP NEVADA MINES.—The difficulties of increased heat and ventilation, are beginning to command attention in the deep mines of the Comstock Lode. A number of the leading companies are now engaged in putting in engines to drive fans for furnishing air to the lower levels, by forcing it through large tubes of galvanized iron. With this great increase of heat in our mines comes a great decrease of water. The Bullion, which has attained the depth of 1,200 feet, being the deepest mine in Nevada, is as dry as a lime-kiln, and as hot as an oven. In the lower workings of the Chollar-Potosi mine, which are a perpendicular depth of 1,100 feet, the thermometer stands at 100 degrees, and the water has decreased till it has become necessary to run the pump but four hours out of the twenty-four. The water stratum is confined to a space between 400 and 900 feet in depth, so far as explored.

ANOTHER METHOD OF MAKING ARTIFICIAL STONE.—In St. Louis there is an establishment for making mantels, etc., from silicate of soda and sand. Flint (silicic acid) and soda are melted together in such proportion as to make a viscid substance. This, mixed with the sand, is ground in a mill and becomes plaster-like putty. It is then pressed into molds by hand. In a few hours it becomes perfectly hard, and is as perfect as the carver's work of months.

This process seems to be adapted to the sage brush State, where pure carbonate of soda has been found plentifully.

STILL another kind of artificial stone has been invented by M. Sorel. It is prepared by combining a saturated solution of chloride of magnesium with calcined magnesia. Billiard balls and ornamental objects are made with this, and a thinner paste of the same material serves to consolidate twenty times its weight of sand and similar material for the formation of tiles and flags or other rougher articles.

TOLL RAILROADS FOR COMMON WAGONS. To avoid the inconvenience of periodically impassable roads, to which most localities in California are subject, the *Alta* suggests that railroads could be built economically for the use of common vehicles. Being made for horse teams, the grades would not need to be so regular, nor would the curves require to have radii so long as on the steam roads. Tolls might be collected in the same manner as on turnpikes; and the charges could be higher, while the expenses of collecting would be no greater. It would be necessary to have a double track, so that a continual striug of wagons could pass each way.

PRODUCERS WANTED.—It is very evident from the present aspect of things that we have reached the point at which a modification of the producing and the distributing force of the community must be affected. A portion of those now using their capital or their labor in the distribution of products, that is in trading operations, must become workers in one branch or other of productive iudustry, especially in agriculture or mining. This is needed in order to increase our supply of products, which being effected we should have lower prices; and prices lower aud increased consumption, and cularged and healthier trade. *Economist.*

HARDNESS OF IRON.—The durometer is the name of an instrumeut recently introdnced into use for testing the hardness of metals. It consists of a properly constructed drill, operated with a given uniform pressure and continued for a certain number of turns. The hardness of the metal is determined by the depth to which the drill will penetrate with a given number of turns. Most of the French contracts for railroad iron are now conditioned upon a test by this apparatus.

THE "LAMP-POST RAILROAD" in New York, along Greenwich street from the Battery to Fulton street, appears to be a success. The track is on posts, and occupies the place that awnings now do. Cars have been run from ten to fifteen miles an hour with safety aud comfort, it is said. The wheels are of wood where they come in contact with the rails. A stationary engine, operating by means of a wheel and endless cord, is the motive power. The new company has given bonds to complete the road to the vicinity of Central Park within a specified time.

MANGANESE.—A bed of this mineral has been located by J. B. Milligan, at the eastern base of the Jackson Butte, Amador County.

REFORM IN IRON SHIPBUILDING.—The New York *Times*, in a recent article, says the great point in iron shipbuilding is to use the material to the best advantage. We quote: "A rib placed where it can receive a maximum strain costs no more than a rib placed where it is merely dead weight. A ship is primarily a beam. As a beam it receives every strain of the sea. Now, a bridge or any girder made up of a thin, light web, running from end to end, and great vertical parts without longitudinal connection, would hardly sustain itself. Yet a ship so constructed is expected to hold up the enormous weight of its unsupported ends every time they overhang the trough of the sea, and of its partially supported middle every time the ends are buried in the waves—a constant and powerful vertical and lateral strain upon every joint in the hull. The great strain on a ship is the perpetual pulling apart and shutting together of its bottom and deck in a longitudinal direction, and the great number of iron ships have been built without sufficiently strong bottoms and without any top strength except their sides. Many ships have first broken apart at the top sides and then gone to pieces. Heavy, continuous iron decks or strips of iron deck along the sides have partially remedied this evil. But the grand reform in this direction is to make the frames, the *ribs* of the vessel, longitudinal instead of vertical. Now they are chiefly studs upon which to nail the siding. By making them continuous from end to end, they perform every present function and add their enormous strength *in the direction of the greatest strain*. Some genius has objected to the longitudinal rib system because the ribs of fishes are vertical. But while the rolling top of the sea forms a constantly varying support for a ship, a fish swims in a uniform medium that would not bend a reed—not on the water, but under it—and it has been observed that ships built like fishes have a tendency to do the same thing.

If our iron shipbuilders will place our superior iron where it can work, so as to use less of it, they can at once and successfully compete with foreign builders in cost and quality, and so revive not only our workshops but our merchant marine."

ANNEXATION OF THE SANDWICH ISLANDS. The King of the Sandwich Islands, in consequence of the annexation agitation by America, has threatened to place the island under British protection if his nationality is interfered with.

ELASTIC SPONGE,

A SUBSTITUTE FOR

CURLED HAIR,

—FOR—

ALL UPHOLSTERY PURPOSES.

Cheaper than Feathers or Hair,

AND FAR SUPERIOR.

THE LIGHTEST, SOFTEST, MOST ELASTIC, DURABLE and best material known, for Matresses, Pillows Cushions, etc. It is entirely indestructible, and its purity is almost immaculate. No moth, no smell, no dirt. It does not pack at all. Is always free from insect life; is perfectly healthy; and for the sick is unequalled by any bed in the world. Special attention given to furnishing Churches, Halls, etc. Satisfaction guaranteed.

W. R. STRONG,

General Agent Pacific Elastic Sponge Company, 617 Market street, San Francisco. 19v16 6meow

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

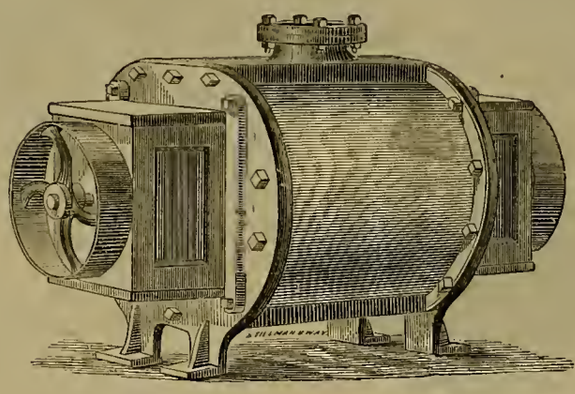
THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

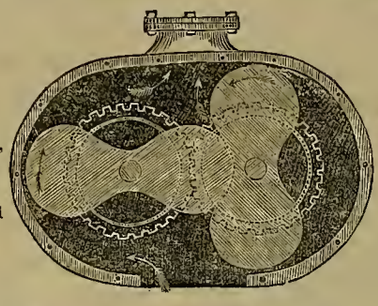
N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address



J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16 6m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP, BLAKE & CO.,

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

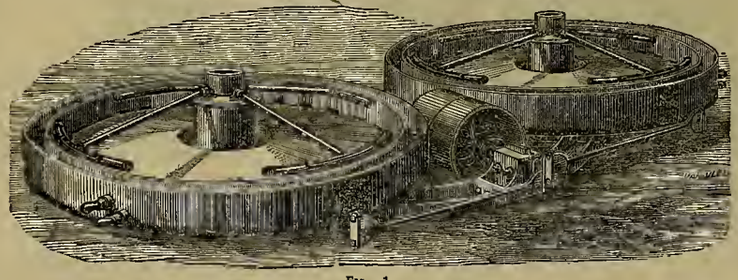

FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

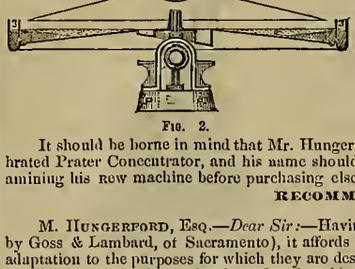

FIG. 2.

Fig 2 is a section through the center of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

NEWCASTLE, Cal., June 21, 1868.

M. HUNGERFORD, ESQ.—*Dear Sir*:—Having used eight of your improved Concentrators (built by Goss & Lambard, of Sacramento), it affords me pleasure to bear testimony to their efficiency and adaptation to the purposes for which they are designed. I have used various styles of Concentrators during the last five years, but have found nothing that begins to compare with your machine, for durability and thorough concentration; and I can confidently recommend them to millmen, being, in my opinion, the best Concentrator now in use. Yours truly,

J. C. COREY.

NEWCASTLE, Placer County, Cal., June 23, 1868.

Mr. MORGAN HUNGERFORD, ESQ.—*Dear Sir*:—After witnessing the operation of eight of your Concentrators for a month, in the Golden Rule mill, Placer County, and running the same number in the Mt. Pleasant mill, El Dorado County, I am satisfied they are superior, as Concentrators, and more durable and less liable to get out of order, than any Concentrators I have seen; and I recommend them to millmen, feeling assured they will, after the most thorough trial, be pleased with them.

Very respectfully, L. E. ATCHISON, Metallurgist.

BIG OAK FLAT, May 23, 1868.—*Mr. Thos. Mulford*—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco.

In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, $300

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for matresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to palm, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

$100 A MONTH SALARY WILL BE PAID FOR Agents, male or female, in a new, pleasant, permanent business. Full particulars FREE by return mail, of sample, retailing at $4 50, for 50 cents. A. H. BOWMAN & CO., No. 4 Broad street, New York.

[Cut out and return this notice. 6v17-7t

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

PIONEER DAY.—On Wednesday the Pioneer Society celebrated the eighteenth anniversary of the admission of California into the Union. Hon. E. D. Wheeler delivered the oration, in which, amongst other things, he said:

If the commerce of the great East in centuries goue hy, nourished the wealth of a hnndred cities; if it gave power to Thehes, glory to Sidon and Memphis, magnificence to Perseopolis, opulence to Ecbatana, and built amid the sands of the desert the marhle temples of Palmyra, who shall say that within the next hundred years it will not contrihute to make of San Francisco the most imperial city of the globe.

To partially realize the capacity of California, we have but to compare it with other States. With a population as dense as that of the State of New York, we would have within our borders 13,500,000 inhabitants; with the density of Massachusetts, we would have 25,000,000; with the density of France, 33,000,000; with that of Great Britain, 40,500,000; and had we as many people to the square mile as Belgium, our population would reach the enormous aggregate of 74,000,000. A work on international law, written by an American lawyer, has been translated into the Chinese language, and is now the accepted text hook at the capital of the Empire. We may now adopt the language of Louis XIV., addressed to his grandson on departnre to assume the Spanish Crown: "There are no longer any Pyrenees." The barrier to the eastward, that walled us from the world, has heen leveled; the 1,600 miles, stretching from the Sacramento to the Missouri, and which occupied the early emigrant 100 days in traveling, will soon be compressed into 100 hours luxurious journeying.

A TRIO of California inventions may be seen on the shelf by the halanced oscillating engine which runs the FAIR PRESS.

First, we will mention Detrick & Eckart's pocket counter, which looks like a smooth brass wheel, ½-inch face, and diameter hut a little in excess of an old-fashioned watch. It contains several gauged wheels and rings, operated hy a spindle, which may be prepared to apply instantly to any journal, at full speed, and accurately report the numher of revolutions. This is a handy tool, so simply constructed as to cost about $2.50 only.

J. S. Detrick's eccentric chuck, an adjustable labor-saving tool, just patented, is a simple, ingenious device applicable to the turning of eccentrics. It must he examined by mechanics to be understood and appreciated.

Wm. Kewin, master pattern maker, shows an improved hevel for laying off teeth for gear wheel patterns, well calculated to facilitate work in this branch. These inventions are all by men in the Union Iron Works of H. J. Booth & Co.

TELEGRAPHING WITH THE EARTH'S ELECTRICITY.—Geo. M. Dugan, of Booker Ford, and Colonel Coleman, of Memphis, have been telegraphing to each other for weeks with a current of electricity sufficiently strong for all practical purposes, drawn from Mother Earth, hy means of one sheet of copper and one sheet of zinc, which are buried to the depth of two feet, and having about four inches of earth hetween them. To the copper-plate, wires are attached, and the current thus procured seems inexhaustible. The operators at the telegraph office at Bolivar have dispensed with fluid of all kinds, and every message sent from Bolivar now is recorded by an instrument which receives its power from the huried battery.

THE most "forcible and striking" invention in the Fair, is undoubtedly the improved trip-hammer of Peterson & Jones, designed for the use of blacksmiths. It has attracted many spectators, who have expressed surprise at the easy manner in which it is controlled by the operator. It must be a very desirahle and economical instrument, tending towards making hlacksmithing rapid and easy. It is further doscribed in our advertising columns.

THE Isham key register bank and safe lock, so widely and favorably known throughout the United States, is exhibited by Mr. Jonathan Kittredge, of the Phœnix Iron Works, in connection with two Monitor safes. Theso safes are now extensively introduced here, as it has hcen many years since Mr. Kittredge commenced to build them.

LAMP EXTINGUISHER.—Fred. Rohrer's Lamp Extinguisher, which has been patented in the United States and several foreign countries, is examined with interest hy exhihitors and considered a good invention. It is a very useful application to a kerosene lamp, extinguishing the light instantly without removing the chimney.

AMERICAN
(WALTHAM)
WATCHES,
THE BEST! THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

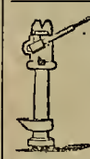
To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.



Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first-class dealers in the United States and British Provinces.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

VALUABLE
Practical and Scientific Books,
RECENTLY PUBLISHED BY
HENRY CAREY BAIRD,
INDUSTRIAL PUBLISHER,
No. 406 Walnut Street, Philadelphia.

Long-Span Railway Bridges.—By B. Baker. Illustrated, 12mo..... $2 00
Practical Specifications of Works Executed in Architecture, Civil and Mechanical Engineering, and in Road-Making and Sewering. By John Blackarn; 15 large plates, 8vo..... 9 00
A Practical Workshop Companion, for Tin, Sheet-Iron and Copper-Plate Workers.—By L. J. Blinn. Illustrated, 12mo..... 2 50
Practical Hydraulics.—By Thos. Box. Illustrated, 12mo..... 2 00
Mineralogy Simplified: A Short Method of Determining and Classifying Minerals, by means of simple Chemical Experiments in the Wet Way. Translated from the last German Edition of F. Von Kobell, with an Introduction to Blow pipe Analysis, and other additions.—By Henri Erni, M. D., Chief Chemist, Department of Agriculture, 12mo..... 2 50
Tables for Qualitative Chemical Analysis.—By Prof. H. Will. Seventh edition; Translated by Prof C. F. Himes, Ph. D., Dickinson College, Carlisle, Pa..... 1 25
The American Cottage Builder—A series of Designs, Plans, Specifications, etc, for Homes for the People, from $200 to $20,000.—By John Bullock. Illustrated, 8vo..... 3 50
The Complete Practical Distiller.—By M. L. Byrne, M. D., 12mo..... 1 50
The Essential Elements of Practical Mechanics.—By O Byrne, Illustrated, 12mo..... 3 63
The Principles of Mechanism and Machinery of Transmission: Comprising the Principles of Mechanism, Wheels and Pulleys, Strength and Proportions of Shafts, and Engaging and Disengaging Gear.—By William Fairbairn, Esq., C. E. Beautifully illustrated by over 150 woodcuts, 12mo..... 2 50
The Painter, Gilder and Varnisher's Companion: Containing Rules and Regulations in everything relating to the Arts of Painting, Gilding, Varnishing, and Glass Staining; with directions for Graining, Marbling, Sign Writing, and Gilding on Glass. To which are added Complete Instructions for Coach Painting and Varnishing, 12mo..... 1 50

☞ The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address. 20v16tf

MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, SEPTEMBER 19, 1868. VOLUME XVII. Number 12.

Table of Contents.

Pracy's New Engine Regulator—Illustrated.
Patent Cigarette Rollers—Illustrated.
Corrosion of Iron.
Close of the Fair.
Comparison with other Fairs.
Special Mention.
What the Mechanics Institute Does and Offers.
The Blanks.
Silver Chlorination.
Royal Geographical Society.
Mining in El Dorado County.
Lecture on Chemical Geology.
Submarine Navigation.
Resources and Position of Alaska.
Patent Elastic Soles.
The Soda and Salt District of Mexico.
The Davy Lamp Superseded.
Institute Fair Premiums.
San Francisco Market Rates.
Stock Prices—Bid and Asked.
MECHANICAL MISCELLANY.—Use and Care of Tools; Porosity of Hydraulic Cylinders; Compressed Air for Propelling Street Cars; A New Bayonet; Velocipedes; Smoky Chimneys; A New Projectile.
SCIENTIFIC MISCELLANY.—The Moon and the Weather; Falling Stars; Liquid Fuel Combustion; Tungsten Steel Magnets; Oxygenized Blood and Decapitation.
MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Colorado, Bacotah, Montana, Nevada, New Mexico, Oregon, Arizona and Utah.
San Francisco Mining Shareholders' Directory.
New Patents and Inventions.
Notices to Correspondents.

PLUTONIC INFLUENCES have been in the ascendant in the minds of our townsfolk for a few days past. The high spring tide of Thursday was pronounced an earthquake, wave heralding dreadful occurrences elsewhere, and the smoke from the burning redwoods on the northerly and seaward side of Tamelpais, which has been rolling calmly over the ocean and bay, owing to an unusually light atmosphere, was associated with Kilauea, and with the fires which are reported by telegraph to be devastating the forests of Oregon and Washington. Between Cowlitz and the junction of the Willamette, an area of 200 square miles is reported burning.

The dreadful earthquake of the 13th of August in South America no doubt laid the foundation for the many surmises which were credulously circulated. It is stated that no earthquake has occurred during the present century whose effects have been so disastrous in that country. The earthquake wave seemed to originate near the equator and to travel southward, so far as South America was concerned. In Ecuador and Peru there were two waves discernable, which crossed each other. Transit instruments were thrown out of level at the same time at the Sandwich Islands. It is surmised that the sources of disturbance are probably connected with the volcanoes of Agualougo and Cayambes. On the 14th of August an earthquake wave was observed at Los Angeles.

MINING IN EL DORADO AND AMADOR COUNTIES.—We have received additional communications from our traveling correspondent, describing the mines and mining operations at Diamond Springs, Sugar Loaf, Nashville, Placerville and Pleasant Valley, in El Dorado County, and at Amador City, Spring Hill, Sutter Creek, Jackson and Pine Grove, etc., in Amador County; all of which will appear in due season.

ICE MAKING.—A gentleman wishes to know if any parties in San Francisco are prepared to furnish machinery for producing ice economically in quantity—say 1,000 pounds in twelve hours. Any person who will give written information to this office on this subject, stating cost of machinery, amount of power and other necessary expenses required, will confer a favor. Information from manufacturers about it are solicited.

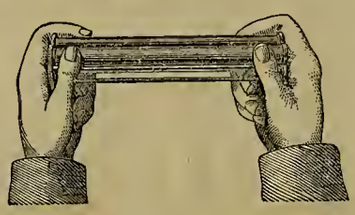
Pracy's New Engine Regulator.

With great pleasure we chronicle substantial improvements wrought out from time to time, by the steady working, practical mechanics, who seem more deserving of success than inventors who stumble into good fortunes by making accidental improvements entirely out of the line of their practice.

It is with these feelings that we herewith present an illustration of a recent invention by Geo. T. Pracy, of No. 109 Mission street, in this city, of an improved governor for steam engines. The engraving shows the

regulator with the arms extended, as if in rapid revolution. The balls are confined by jointed arms, hinged at the top and bottom, and having a knuckle-joint in the center. The slack is taken up and the valve of the regulator opened by the action of gutta percha springs, situated in the cylinders or pots on the right and left—operating by the plungers which are connected by lugs to the lower portion of the arms.

This regulator assumes somewhat the appearance of the Pickering Governor, but it is much simpler, having no spring bands to be nicely tempered and adjusted, and liable to breakage and repair. It is suited to any rate of revolution. The speed of an engine can be quickly adjusted by turning set-screws on the bottom of the cylinders which operate on the rubber springs.



While this regulator can be made as cheaply as the ordinary governor, the inventor, one of our best mechanics, who has had one in operation for sometime, confidently claims it to be the best regulator in use. An ordinary mechanic with a common blacksmith forge could repair any of its parts in case of damage by accident. The force of the springs produce constant bearing on the various joints, preventing any loose motion of the same. It is more neat and cleanly than the common regulator.

Mr. Pracy has applied for letters patent, and already sold several of his governors. He invites the examination of the one in operation at his shop, by all parties interested. We regret that this California invention was not in season for exhibition at the Fair.

Patent Cigarette Rollers.

Although an experienced hand is supposed to make a handsome cigarette in comparatively quick time, yet when we come to apply the little piece of mechanism here represented, the old seems like a slow process of manufacture.

The Hazman Excelsior Cigaretto Roller is being introduced with favor in the Eastern States, and is certainly a novel instrument. The rollers are about ⅛-inch in diameter, and 3½ inches in length. Its principles of operation are well illustrated by the following directions for use:

Hold the machine in a horizontal position, the hinge-bar below, the rollers above, resting on the palms of the forefingers, and the thumbs being applied on the inner, the forefingers on the outer roller. Open the frame, so as to form of the india rubber hand a trough, or receiver, upon which the requisite quantity of tobacco—about three pinches—is equally spread and slightly pressed, so as not to prevent the rollers from joining. Close the machine and turn the rollers a few times; the thumbs on the inner roller gently operating downward, and the forefingers on the outer roller upward, assisting the motion evenly. Then insert one of Hazman's Patent Cigarette Wrappers into the gap between the upper roller and tobacco, having the prepared or adhesive surface next the tobacco; close and rotate, slightly pressing the rollers together, but using no force, during the process. The wrapper having nearly disappeared, wet its margin—a few more rotations will complete the cigarette.

The wrappers used with these rollers are of the natural color of tobacco, and are so prepared as to destroy the bad taste and influence possessed by paper commonly used for wrappers. For further information in regard to this invention, address A. H. Hale, box 17, San Francisco P. O.

THE BENEFITS that were given during the last week of the Mechanics' Fair, resulted in substantial aid, as follows: For the Roman Catholic Orphan Asylum on Monday, $648.50; for the Ladies' Protection and Relief Society on Tuesday, $631; for the Protestant Orphan Asylum on Wednesday, $1242.75; for the Female Hospital and S. F. Benevolent Asylum jointly on Thursday, $700; and for the Mechanics' Institute Library on Friday, $690.25.

CENTRAL CALIFORNIA.—Mr. Doolittle has published a new map of Central California, embracing the counties of Butte, Yuba, Sierra, Nevada, Placer, El Dorado, and Sacramento.

ROYAL GEOGRAPHICAL SOCIETY.—Bishop Staley, of Honolulu, read a paper before the Royal Geographical Society, recently, on the "Geography of Hawaii, and the Recent Volcanic Eruptions," in which he stated that according to the census of 1867, the native population had continued to decrease as much as 8,300 during the past seven years, the total being now 58,765, while the whites had increased 400, numbering at present 4,194. Industrial girls' boarding schools were being established, to check the evil at its source. The whole archipelago had been lifted out of the ocean by volcanic agency, which began in the northwest islands, and gradually extended to its present seat of activity on the southeastern island of Hawaii, dying out behind. Coral beds were found at an elevation of 4,000 feet above the sea. At the recent eruption, mud streams burst up through the soil, and buried villages and ranches. The column of vapor which issued from Kilauea was visible at a distance of 120 miles, and computed to be eight miles in hight.

ENGLISH TEACHERS AT PARIS.—Pecuniary encouragement was offered by the Science and Art Department of the Committee of Council on Education in Great Britain, to all government instructors who would visit the Paris Exposition, and write reports upon their own technological specialties. Every branch of the useful arts and sciences has been treated upon by persons whose business it is to communicate their information to others. Amongst the teachers named in the *Science Directory*, Mr. Gibsone is mentioned as writing to the *Chemical News* on the chemistry of the exhibition; Mr. Mayer, to the Glasgow *Journal*, on Metallurgical and Chemical Processes and Products; Mr. Bolam, on Navigation; Mr. Davidson, to the Journal of the Society of Arts, etc.

THE "RUTAN FURNACE" has commenced operations at Jefferson City, Montana, upon ores from the Alta Montana lead. It was run continuously for fifteen hours, at the end of which time 500 pounds of rich metal or crude silver bullion was taken from it. An assay of this metal shows it to contain silver to the value of $474 in coin per ton, or at the rate of about $100 to the ton of ore. The first run was made upon selected rock, but it was made under some disadvantages. The operations are superintended by Mr. Fred. Holaus, the same gentleman who was connected with the Essler furnace at Argenta last winter.

GOVERNMENT CHARGES ON TELEGRAPHY. The "Electric Telegraphic Bill" which has just been passed by the British Parliament practically abolishes all private telegraphy enterprise in the United Kingdom, and places the business into the hands of the Post-office Department. Cheapness, universality, and uniformity of telegraphing, are the advantages promised. The government having come to an understanding with the telegraphic companies, no opposition was made to the bill. Doubts of want of efficiency are raised against the plan.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Mining in El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

During the last year, mining in this county has been at a very low ebb. It is now, however, reviving slowly, and on a basis that will experience no set back. Quartz is the main hope, and those who are engaged in working, are thoroughly convinced that they will have to go down deep on their ledges before a clear definition will be given. They are becoming better acquainted with the nature of the broken formation, in many places through which they will have to sink from 400 to 600 feet in depth before establishing a character of permanency to their mines. As yet, the only mine sunk upon to any depth at all, is the Pacific mine, at Placerville. This is down to the depth of 320 feet, and shows a vein of fair looking low grade ore, varying from four to twelve feet in width. Mr. A. Stephens, of San Francisco, is prospecting the lead with intent to purchase; intends to sink another 100 feet, at an expense not to exceed $5,000, and thinks he can show up a mine second to none in the State. This lead has been worked to the depth only of 180 feet, and yielded, all told, nearly $600,000. Mr. S. thinks he is north of the principal pay chimney, and by making a short drift south, he will strike the old pay shute; at the same time be sinking for another 100-foot level. In the opinion of the writer, this mine has been wretchedly managed, and through the fault of management—not the mine—work has for a time been suspended.

THE EPLEY MINE,

owned by Swan, McLane, Thomas Price and others, is running, and doing very well. They appear to have a fine shute of ore, heavily sulphureted, showing a width of vein of from four to fifteen feet, are down with their shaft 218 feet, and expect soon to open another level. They are running a 10-stamp water mill, concentrating their sulphurets with two of the old-fashioned English buddles, which are, by the way, exactly the reverse of Paine & Stephen's patent, viz., depositing the sulphurets around the center instead of the periphery of the buddle. The milling is under the immediate supervision of one of Price's graduates, and ought to be done up in a scientific and workmanlike manner. The

CONCORDIA MILL AND MINING COMPANY,

partly owned and superintended by A. Stahl, a graduate of the Mosheimer School, San Francisco, who has erected chlorination works, and is working a small mine yielding a heavy percentage of $150 sulphurets; has a 10-stamp mill, and is down on a 30-inch vein 70 feet; is working exclusively for the sulphurets, obtaining nearly all his gold through chlorination, and in a state chemically pure.

AT GEORGETOWN AND VICINITY,

some little start is being made. The Taylor mine (incorporated) A. Reiser, of San Francisco, President, W. T. Gibbs, Superintendent, has been worked off and on for two years, and is now starting again with very flattering prospects, having opened a 100-foot level that presents a richness and character of ore unprecedented in the history of the mine. The vein is narrow, varying from twelve inches to three feet in width, and has shown free gold all the way from the top down, increasing in richness as they descend. The formation is considerably broken, but the indications for a true vein, to a practical eye, are sufficient to warrant going down, especially as long as appearances improve. Mr. Gibbs appears to comprehend what is wanted, and if permitted by his company will, no doubt, prove a success. At present, they only have a 5-stamp prospecting mill (water power) obtaining $15 per ton on all ore crushed. They have new steam hoisting machinery on the ground, ready to set up at any time, or as soon as needed.

The Woodside mine at this place is lying idle for want of capital to procure heavier machinery. The mine is reputed very rich, and disinterested parties, knowing the mine, express a wonder why capital will not take hold of it.

Two miles from this place, at Georgia Slide, George Beattie is erecting a 5-stamp mill, with capacity for five more when needed, and is working a claim of partially decomposed quartz seams, the ore averaging $15 per ton.

The Blue Rock Company, nearly adjoining the latter, work the same character of ore, and have a 10-stamp (very light) mill, and are doing very well. This is owned and worked by George Rowe & Co.

AT GREENWOOD,

the Glenwood mine is commencing operations. This is owned by a San Francisco company, and superintended by S. P. Leeds, and will have a 5-stamp prospecting mill started during September. This mine consists of an immense ledge or mass of quartz seams and cement, 190 feet in width, all or any of which will pay something, and a portion of the same is considered very rich. Mr. L. intends to prospect the whole vein matter thoroughly, and if it will warrant it, will then erect a large mill with capacity to crush several hundreds tons per day.

AT SPANISH DRY DIGGINGS,

times are about the same as ever, and unlike all other mining towns or camps, this place has undergone but very little change. Here the miner digs away on his quartz seam until he obtains a panfull of dirt or decomposed matter, which he then washes, realizing from $3 to $50 per pan; from one to three pans being considered a day's work. From appearances here, the writer would judge this to be a fine point for investment of capital prospecting for valuable lodes of quartz. This place being situated very high, presents every advantage for working by tunnel. Down the mountain, 1½ miles from town, Messrs. Rousch & Simpers have a very rich lead, which they intend to work very soon. J. N. Williams and others in town are prospecting faithfully, and are expected to strike something good, ere long.

The Pyramid Mine, on

DRY CREEK,

four miles north of Shingle Springs, are working, and appear to have excellent indications for a good mine, but they will certainly have to change their plan of working, and go down, instead of working along the line of the ledge. The rock looks well for top rock, sufficiently so to warrant sinking upon. This mine is owned by Abbott, Gaylord and others. The ledge varies from six to forty feet in width; gold is very finely diffused through the rock, which yields considerable sulphurets, assaying $400 per ton. They have a 15-stamp mill (water power) water free three-fourths of the year. The only draw-back to this mine, is that the rock is not rich enough to more than pay expenses, and instead of sinking, they are hunting for better along the top of the ledge.

COLOMA.

Here is where gold was first discovered in California, and also where the discoverer—Mr. Marshall—still resides. The history of this discovery is familiar to almost every one, and the writer will simply remark that the man who picked up the first nugget, is still hale and hearty, although near sixty years of age. This being the oldest mining camp, one would think it ought to be thoroughly prospected, yet within gunshot of town they are finding rich veins of quartz, some of which have quite recently yielded very largely; among the most prominent is the Last Chance, owned and worked by Nicholsou & Peterson Bros. They have already taken out about $70,000. This ledge is from three to twenty feet in width, and as yet, have only worked off the top. They have done no sinking at all; are running a 10-stamp water mill, and in a very quiet way are evidently making money. There are many other leads here that promise well, and are only waiting for capital to open them. A few miles above, at Kelseys, there are one or two mines working successfully.

[To be continued.]

PROF. WARD'S MONTANA COLLECTIONS. The mineralogical and geological cabinet now owned by the university of Rochester, is, in classification and completeness, considered by certain authorities to be the finest in the United States. Prof. Ward spent eight years in collecting and arranging it. Persons in different parts of the country are forwarding material for a zoölogical collection, which, when completed, will compare favorably with his former collections. The few specimens lately sent from Montana, are an elk skeleton complete, a mountain lion, mountain sheep, gluttons, and several smaller animals.

NOBEL'S NITRO-GLYCERINE manufactory at Stockholm, was recently blown up, killing fifteen persons.

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

In considering a subject so extended and important as Chemical Geology, it is evidently impossible, within the limits of one lecture, to put forth anything like a complete exposition of its principles, or to enter into details; this evening, therefore, I propose, after a few introductory remarks explanatory of the principles which have guided me in my investigations, to venture upon a short sketch of the chemical geology of what may be termed the cosmogenctic era in the history of our globe, and then to attempt an explanation of some of the phenomena connected with the great changes which have taken place in the earth, from that early period down to the present time, in which chemical action has played an important part.

The history of the natural sciences fully shows how often their votaries have allowed themselves to be influenced by some often preconceived hypothesis, which has lead them to ascribe to some one favorite cause effects which in reality have proved to be the result of a combination of several causes.

To this tendency may be attributed the formation of the opposing schools of geology, the Plutonic and Neptunic, or igneous and aqueous. Yet it must at the same time be remarked that this occurred at a time when experimental science was hardly out of its cradle.

The rapid strides in advance made by all the natural sciences in every direction, have now, both by the accumulation of facts, and the elucidation of the laws which govern them, shown how difficult, if not impossible it is, in the study of nature, to draw any sharp line of demarcation as to where any one cause ceases, and another begins to operate.

Increasing and more exact knowledge shows that mere fire and water are not the only great agents that work the changes that have taken place, and still do take place in our globe, and that the geologist, in order to arrive at sound conclusions, must take the various effects produced by chemical action, heat, light, electricity, and mechanical force into full consideration.

The study of the correlation of these forces is also one which, although as yet but in its infancy, promises great result in the explanation of geological phenomena. It has now been satisfactorily proved, that mechanical force may, if not directly, at least indirectly, be converted into chemical action, or in other words, cause forces, formerly regarded as purely chemical, to be brought into play, so that the assumption that mechanical forces can only give rise to what have been termed mere mechanical results, must be guarded against in consideration of nature's phenomena.

Every geologist admits the great part which mechanical energy has taken in bringing about the changes in the physical configuration of this globe; as, for example, amongst others, the compression, crumpling up, and consolidation of strata, and in the elevation, depression, and dislocation of enormous rock masses, effects which have characterized, and still do characterize the history of the earth; and as it is known that the expenditure of mechanical power is attended by a corresponding development of heat, which in its turn may give rise to a proportionate amount of chemical action, it evidently becomes a subject of great interest to inquire into how far such conversion of mechanical into chemical force may have assisted in the metamorphic alteration of rock-masses.

The familiar experiment of striking a light with flint and steel is an excellent illustration of the conversion of mechanical force into heat, along with the development of chemical action; for the effect of the mechanical energy exerted is to heat the minute particles of metal detached from the steel to such a degree as to enable them to combine chemically with the oxygen of the air; the heat generated being then so intense, as to fuse the product into minute spherieles of magnetic oxide of iron, as can be seen when the sparks are collected on paper, and examined under the microscope.

Whilst directing attention to the importance of the study of this subject, the geologist not versed in chemistry must, however, be warned against attributing too much to such agency, especially when examining what appears to the eye to him to be the transition (or transmutation) of one rock into another; for before accepting such evidence, the chemist will insist upon previous proof by chemical analysis that there are present in the one rock the chemical elements requisite for the formation of the other; or if not, that there is a rational mode of explaining how any deficiency in component parts has been supplied, or any surplus removed.

The study of electricity (with magnetism) in its relations to geology is not unlikely to throw light upon some now obscure points, but has not yet been much attended to, and I must confess that an examination of what has been written upon the application of electricity to explaining the formation of mineral lodes, makes one suspect that the effect has at least in some cases been mistaken for the cause; and that the electricity which was supposed to have brought about certain chemical changes, may have in reality been the result of these very changes, and not their cause.

After thus insisting that the investigator in the study of chemical geology must of necessity call in to his assistance a knowledge of the collateral branches of the natural sciences, I may here state, that in appearing before the society to-night, I do so not as a partisan of any school of geology, whether Plutonic, Neptunic, quiescent, or cataclysmic, but as an independent observer, who believes that the principles upon which all these schools have been founded have each had a share in nature's operations, and that they therefore must be taken into equal consideration, and who further assumes that most, if not all the phenomena of nature have been effected by a combination of more forces, and that the same identical phenomena may at times be the result of agencies, totally different from those which at other times may have given rise to them.

The study of mineralogy, which is the alphabet of petrology, shows that very many mineral species, and amongst them some of the most common rock-constituents, may have at different times been formed by very different processes.

Thus, amongst the specimens here on the table before us we have crystallized silica or quartz occurring in nature—

As an igneous product in recent volcanic lavas.

As an aqueous product from crystallization and deposition from solution.

And as a gasolytic product in tubes from the decomposition of its compounds with fluorine.

Sulphur is also seen—

As an igneous product from volcanoes.

As an aqueous product, both from hot springs and as a product of decomposition of sulphides.

And as a gasolytic product from fumeroles.

And several others.

Experimental researches on the artificial formation of minerals also prove satisfactorily that the same mineral or product may be obtained artificially by very different, often the most opposite processes and reactions.

Thus we find silica in the hearths of iron furnaces, formed by igneous action, apparently by the oxidation of silicon.

In the wet (or aqueous) method, silica is obtained in the decomposition of silicates by acids.

And lastly, it can be produced as a gasolytic product from the decomposition of these compounds of silicon with chlorine and fluorine.

Again, we can produce, by analagous processes, sulphur and carbon, either as igneous, aqueous, or gasolytic products, and amongst other specimens on the table will be found fine specimens of crystallized metallic copper, produced artificially, both by igneous and aqueous process, as well as from condensing the vapors which are evolved from the copper refineries.

Feldspar has been produced artificially as a furnace product, as well as by the action of water; and even some of the zeolites or hydrated silicates have been produced experimentally, both by igneous agency as well as by aqueous actions.

Numerous other examples might be brought forward in addition to those here mentioned; and the conclusion I would deduce from their consideration, is that it is impossible to be over-cautious in attributing the formation of minerals, or of the rock masses in which they occur to any one cause, to the exclusion of other agencies.

Before proceeding further, it appears advisable, in order to prevent misunderstanding, that the precise meaning attached to certain terms employed in geological inquiry, should be clearly defined, as they are likely to occur repeatedly, in the course of this evening; amongst these the terms igneous, aqueous, and gasolytic are of most importance.

[Continued in our next.]

WHEN you are angry, don't write. Words when spoken are air, but when written they are things.

Mechanical.

Use and Care of Tools.

It is said the Yankees are the most inveterate whittlers in existence, and we once heard one of our Yankee friends remark that the most valued and indispensable of his possessions were a pocket knife, pocket comb, and watch, with true national or natural instinct, placing the knife at the head of the inventory. Yet comparatively few who consider the pocket knife a necessary adjunct seem to understand its care. It is seldom one can borrow a fine knife from an acquaintance. It is either left as it came from the manufacturer, or has its edge rounded so its cross section is a conical wedge, or it is abraded to tenuity by the action of the coarse stone of the street grinder's machine, one of the most ruinous contrivances for sharpening knives or razors. But besides the neglect of the edge of a knife blade, the heel, which acts on the back spring, and the rivet in which the blade turns, are seldom oiled, and it requires an effort not only to open a blade but also to close it.

As the pocket-knife comes from the manufactory or store, its edge is unfit for use; it may cut butter or cheese, possibly soft wood, but it will not pare finger nails or sharpen lead pencils. It needs the hone and strop to produce an effective edge. And in the proper use of the bone, or oil stone, many are quite ignorant. First, nothing but a good oil stone is fit for sharpening a knife blade. Ordinary "whetstones," mere sandstones to be used with water, or dry, are too coarse; they are but fixed grindstones, and rapidly abrade the substance of the blade without giving it an edge. The philosophy of whetting or honing is a gradual and mutual abrasion of the particles of the stone with those of the steel. The oil, with its glutinous quality, holds these commingled particles, so that by the movement of the blade they act on the steel, and abrade it very gradually. If the stone is too hard it quickly glazes, and the blade slips over a perfectly smooth surface, producing no action on the hardened steel; if too soft, the stone allows the edge of the blade to disintegrate its surface and heap up a ridge of quartz-like or flinty particles, which produce a round or "stunt" edge, that in time must be removed by the action of the grindstone. One accustomed to sharpening knife blades can easily tell when the operation of honing is going on properly, and only experience can fully teach the process. There should be a certain feeling of resistance in the operation. The motion for whetting or honing should be circular; not as in stropping a razor, merely back and forth. The educated fingers will readily feel when the blade bears properly on the surface of the stone, and will guard against the mere abrasion of the back and the cutting in of the edge. This art can only be acquired by practice.—*Iron Age.*

Compressed Air for Propelling Street Cars.—New Orleans seems to be taking the lead in devising new methods for propelling street cars. Mr. Wayliss, of that city, has recently invented a car which is said to have proved a complete success. In the car station there is an ordinary steam engine of about 66 horse power for compressing air into reservoirs, which are made of a paper composition, and two of them are placed on top of the cars. On each car there is a small engine operated by air supplied from the reservoir in the same manner as steam, giving the exact amount of power that was required to compress the air. The engine is not difficult to run, and the cars can be stopped much more readily than when horses are used. Each car will have 300 pounds of compressed air to start with, which will be sufficient to run it nine or ten miles. The exhausted air, as it escapes from the engine, may be used for ventilation. In New Orleans there are 5,000 mules and in New York 40,000 horses, said to be employed in the various railway lines. By this method of compressed air, they will be superseded, as it is cheapor, and at the same time, less wearing to the conscience of riding humanity.

Porosity of Hydraulic Cylinders.—To stop up a porous cylinder cast for a hydraulic press, Kohn, a Berlin engineer, heats it over a charcoal fire to about 176° Fah., then fills it up with resin, and suspends it by a crane over the fire, until the liquefied resin is seen sweating through the outside. The excess of resin is then poured out, and the cylinder allowed to cool. The pores will be found so completely stopped, that no water can possibly pass.

Smoky Chimneys.—A correspondent of the *Builder* submits a simple and cheap remedy for smoky flues, which is stated to be successful in eight out of ten bad chimneys. The principle upon which it depends is sound. He says: "I find from experience that, by the use of fine wire gauze of from thirty-six to forty wires to the inch, as a screen, blower, or guard, judiciously applied to register stoves, ranges, or stove doors, little if any smoke will come into the room through the gauze, and if applied immediately to the front of the fire more smoke will be consumed than by any other means. In that case the wire should be kept two inches from immediate contact with the hot fire."

A New Kind of Bayonet has been invented by Colonel Rice, in the shape of a steel trowel, nine inches long, and three or four wide. It is designed to enable troops to cover themselves very rapidly. In the last war, the troops did this with knives, spoons, fingers and their bayonets, with which, however, they could not scoop up the earth. This provides them always with facilities for entrenchment. Colonel Rice estimates that a line could throw up twenty inches of dirt in ten minutes, so that troops need never to be caught out of shelter. That this weapon would not answer all the purposes of the old bayonet must be admitted; but it is urged that the weapon is now obsolete; that not a hundred men were killed by it during five years of war.

Velocipedes are much in vogue now for rapid and easy movement, and grace of evolution. They have one fore and one hind wheel, and are kept upright by the skill of the rider in turning the front wheel, so as to regain his balance. In the south of France, near Toulouse, there was a race, not long since, between a *velocipedist* and a horseman for a distance of forty-five miles, which the latter only won by twenty-five minutes, after a run of six hours. The result, it is said, might even have been reversed, and the inanimate have beaten the animate machine, had not the former been impeded by a strong head wind, which was blowing the whole time.

A New Projectile.—We were last evening shown a new invention called the "improved projectile." It is a three-flanged cannon ball. The inventor, Mr. A. F. Potter, claims that this ball can be thrown from a smooth bore Rodman gun with greater accuracy and force than any ball fired from the rifled cannon now in use. Mr. P. has for the past six years been engaged in working out this invention, and thinks he has it now nearly perfect. This will be proven by a trial very shortly of his gun and projectile, the result of which we will lay before our readers.—*Oakland Transcript, Sept, 11th.*

Submarine Navigation.—An account is given in the Marseilles *Nouvelliste* of a successful method of submarine navigation and perambulation which has been employed there in doing work under water. The air is supplied by a mechanical and chemical process combined. Before the vessel is let down, a provision of compressed air is secured by means of pumps, and distributed among the various compartments; it is calculated to balance the pressure of the column of water she is to encounter at the depth required. The immersion of the submarine boat is obtained by increasing her specific weight through the introduction of water into her reservoirs; the immersion is effected by the expulsion of this water, which latter, therefore, acts as a movable ballast. The boat's center of gravity is so arranged as to make her touch the bottom with her base flat, and almost without a shock. When the ground has not been explored before, the vessel is kept in suspension until, by a skillful manœuvre, a proper place is found for her. By ingenious contrivances, an exact equilibrium is obtained between the compressed air and the column of water, and the trap doors communicating with the bed of the sea are then opened. The men, standing with their feet on the latter, but having their heads still in the chamber containing their supply of air, carry the boat to the spot they want to explore; but if they find it necessary to leave the craft, each puts on his scapbander, or water-tight helmet, provided with a hose, through which he receives air from the vessel, and which is screwed to one of the reservoirs of compressed air, and can thus work at a tolerable distance from the boat.

Scientific Miscellany.

The Moon and The Weather.

Professor Elias Loomis read a paper before the American Association for the Advancement of Science upon the "Influence of the Moon upon the Weather," of which the following is an abstract:

Several meteorologists have attempted by a comparison of a long series of observations to determine if the moon exerts any influence upon the weather. From a comparison of twenty-eight years of observation in Germany, Schubler, in 1830, deduced a sensible influence of the moon, the number of rainy days at the time of the second octant being twenty-five per cent. greater than at the time of the fourth octant. From a comparison of observations made at Paris, Orange and Carlsruhe, Gasparin arrived at results not differing greatly from those of Schubler. By a comparison of sixteen years of observation at Greenwich, nine years at Oxford, and sixteen years at Berlin, Mr. Harrisen, of England, has obtained results which are remarkably consistent with each other, and which indicate that the moon exerts an appreciable influence upon terrestial temperature, the maximum occurring six or nine days after the new moon, and the minimum about four days after the full. The difference between the maximum near the first quarter and the minimum near the last quarter is two and a half degrees Fahrenheit. These results, which are so different from what might have been anticipated, Mr. Harrison explains by supposing that the moon really attains its greatest heat about the last quarter; but that the heat which the moon radiates to the earth is entirely dark heat, and therefore absorbed by our atmosphere. This heat raises the temperature of the air above the clouds, causing increased evaporation from their surface, by which they are dispersed, and thus there is an increased radiation of terrestial heat to the sky, and consequently a diminution in the temperature of the air near the ground. He supposes that opposite results must occur at the period of minimum heat in the moon. Upon extending the comparison to forty-three years of observations at Greenwich, Mr. Harrison finds still a fluctuation of temperature, but the range is reduced to one degree and one minute instead of two degrees and five minutes. Mr. Ballat, on tabulating a series of seventy years mean daily temperature, according to the moon's age, found that the highest temperature occurred during the seven days after full moon, being almost precisely opposite to the results of Mr. Harrison. Schiaparella has made a careful analysis of 38 years of observations, made at Vigiroano, near Milan, in Northern Italy, and has attained results which are also remarkably consistent with each other. They show that about the time of the last quarter of the moon there is a maximum in the number of rainy days, as also in the frequency of storms, and in the degree of cloudiness.

The Professor then exhibited a table of results which he had deduced from seven years' observation, and drew the conclusion that the moon did affect the weather, and maintained, in direct opposition to Prof. Herschel, that the moon just before its full influenced the weather toward cloudiness rather than clearness, and followed the same law as the sun.

Falling Stars.—At a meeting of the French Academy of Sciences, M. Chapelas sent in a new paper on falling stars, accompanied with a table of the position of the sixteen groups or centers of emanation from which they seem to proceed. The author has discovered that the zenithal distances of these apparent centers are more considerable in January than in February, and that at the same time the corresponding average barometrical pressure follow the same law.—*Galignani.*

Oxygenized Blood and Decapitation. The *Revue Populaire*, of Paris, gives an account of some very curious experiments made by Dr. Claude Bernard. If oxygenized blood be injected into the arteries of the neck immediately after decapitation, warmth and sensibility return, the eye gets animated, and displays such perception that an object shaken before it will cause winking of the eyelids and movements of eyeballs as though to avoid injury.

A submarine telescope has lately been tried on the river Eure, France, with great success. It is stated that the smallest pearls and the barnacles attached to the hull of a large ship were plainly seen, and that fishes were seen passing back and forth without being disturbed.

Liquid Fuel Combustion.—The Patent Fuel Company, at Doptford, England, burn liquid fuel, or creosote, by a patent process in tar boiling. The liquid is pumped from a reservoir by a small force pump into a boiler, till a pressure is obtained of twenty-five pounds to the square inch, which enables it to be injected with considerable force into the furnace, where the steam is generated. The feed from the boiler, when the pressure is raised, takes place through a small wrought iron gas-pipe, having one coil near the surface of the grate, from which the creosote escapes at a temperature of about 670° to 700° Fahr., through four apertures, each about one-sixteenth of an inch in diameter. The productive power of thirty-six gallons, costing 3s., was equivalent to eight to ten cwt. of coal, while the relative volume was only two-fifths of that of the coal.

Tungsten Steel Magnets.—In a recent lecture, C. W. Siemens, F.R.S., spoke of the remarkable effect of tungsten upon steel, in increasing its power of retaining magnetism when hardened. A horse-shoe magnet of ordinary steel, weighing two pounds, is considered of good quality when it bears *seven* times its own weight. The famous Haarlem magnet supports *thirteen* times its own weight. But Mr. Siemens has succeeded in producing a similar horse-shoe magnet of tungsten steel, which will carry *twenty* times its own weight suspended from its armature.

Synthesis of Neurine.—M. Wurtz has succeeded in preparing by synthesis, chlorhydrate of trimethyloxethylammonium. It is in long deliquescent needles, and is identical with the neurine usually obtained from brain matter. *L'Institut* gives an account of M. Wurtz's experiments.

A Prussian chemist has invented a new method of warfare on the battle-field. It is a powder that makes a whole regiment sneeze for half an hour.

Discovery of Gold Fields in South Africa.—Gold has been found pretty extensively in South Africa, between 17 and 21½ degrees south latitude, and about 400 miles distant from Pretoria, the nearest point of civilization, in the South African Republic of Transvaal. The kingdom of Sofala, situated on the coast to the eastward of the alleged gold formation, has heretofore been considered to be the *Ophir* of King Solomon's time. Messrs. Hartly & Mauch,—the former an old elephant hunter, the latter an emissary of a Berlin Scientific Society,—report that the gold is found in quartz veins, and that the fields are of vast extent. The natives are known from old times to have brought gold to the Portuguese in quills. They are said to light big fires to loosen the rock containing visible gold, and then further disintegrate it with their "mashetes."

The California Pioneer Fuse Manufacturing Company commenced business in this city in 1866. Their factory is located on the Potrero, and is in constant operation for the manufacture of all kinds of safety fuse for blasting purposes. They employ at present 12 men. They are the first company which commenced the manufacture of the article, and their first work was done in January 1855, at Grass Valley, by James Eva, the inventor of the machines. The samples exhibited by the company comprise submarine water-proof tape fuse, single, double and triple, and common dry ground hemp fuse. A section of the first fuse made in the State, by Mr. Eva, was exhibited at the recent Fair. The capacity of the manufactory at present is about 12,000 feet per day, and as the demand increases, the facilities of the company are enlarged. The jute and flax thread is imported from Dundee, Scotland, but the company are about to erect machinery for spinning their own jute and flax. The other materials used are imported from the East, except the powder, which is made by the California Powder Company at Santa Cruz. We quote the above from the *Bulletin.*

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Newey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week Ending September 1st, 1868.

81,620.—Improved Machine for Manufacture of Screwed Boots.—Joseph Galli, San Francisco, Cal.:

1, I claim the rigid jaw B, and movable jaw C, operated from below, attached perpendicularly to the plate A, and carrying the screw-plate a, b, at their outer end, the whole constructed and operated substantially as and for the purpose herein described.

2. The cutter F, working close to the sole, together with its operating lever G, link *d*, and arm H, constructed and operating substantially as described.

The object of this invention is to provide an improved apparatus for cutting off the screws after they have been inserted in the soles of boots, and consists of two jaws, one rigid and the other movable, operated by a lever, and is intended to be attached to the machines now used for the manufacture of screwed boots.

81,648.—Improvement in Pumps.—Wm. H. Keep, Stockton, Cal.:

I claim the bail J, in combination with the ring I, the valve-seat H, the frame P, the ring G, and the valve-seat F, as and for the purpose set forth.

81,672.—Improvement in Door Bells.—Oliver B. Oakley and Hiram Rosekrans, San Francisco, Cal.:

We claim the hammer bar G, the cam F, and the two arms a and b, together with the knob I, operating by a horizontal or straight pull, either near the bell gong or at a distance, substantially as and for the purpose herein described.

The object of this invention is to so arrange gong door bells that they can be operated by a horizontal or straight pull, by means of wires leading to any part of the house.

81,676.—Ball Alley.—James D. Patrick, San Francisco, Cal. (Antedated August 25th, 1868.)

1. I claim the springs I, I, attached to the spring-board I′, the holes E, in the pins through which the cords pass, and the weights J, J, in combination with the cords, substantially as described.

2. Constructing the ways C, C, so that the balls that roll from the sides of the alley will not come in contact with those that are thrown against the bank or end of the alley, substantially as herein set forth.

The object of this invention is to provide an improved ball alley, so constructed that when the balls reach the end of the alley, or fall from the sides before they arrive at the end, they will return by their own gravity, and not come in contact with each other, while being propelled or while returning. It also relates to a device for setting up the pins by the player himself, from the playing end of the alley, and consists in constructing the alley at an incline towards the player, At the sides of the alley are ways, one outside of the other, for the return of the balls. The whole forms a pleasant and agreeable mode of exercising the usually tedious game of ten pins.

81,677. — Improved Car and Track for Elevating on Incline Planes.—John W. Pearce, Suisun, Cal.:

I claim in combination with the double inclined track of the described construction a store or freight truck, having one axle shorter than the other, to adapt it to run on said track, and keep a horizontal position while passing up or down the same, substantially as described.

The principal object is to provide an improved plan for unloading or discharging ships at their wharves, and for elevating and lowering merchandise.

81,682—Improved Iron Piers.—Wm. B. Porter, Plattsmouth, Nebraska:

I claim an iron pier composed of a series of tubes encompassed or enclosed by a shell filled in with concrete, and all secured together in the manner substantially as herein shown and described.

81,700.—Improvement in Gang Plows.—P. H. Standish, Martinez, Cal., assignor to self and Oliver C. Coffin, of same place:

1. I claim the wheel E, lever M, with pawl I, and foot-pawl N, and manner of arrangement thereof.

2. I claim the tongue adjusting rod J, clevis R, plate Pl, as arranged and secured to the bed or beam B.

3. I claim the construction and arrangement of the bed B, and the manner of attaching the standards thereto in combination with the tongue adjusting rod J, clevis R, and plate Pl, as shown and described.

4. The crank-shaped standards with slotted and set-screw, substantially as set forth.

81,724.—Improvement in Gang Plow.—James H. Audrews, Benicia, Cal.:

1. I claim pivoting the pole C, to the hounds D, D, by a rod E, and linking the rear end of the pole to the arm G, of the shaft F, or equivaleut device, for raising and lowering the plows without lifting other parts of the frame, substantially as described.

2. The donble jointed frame I, having an apron J, attached and arranged to operate in the manuer substantially as and for the purpose set forth.

3. The manner of connecting the plows to the frame by the slips M, M, slots N, N, with bolts and nuts substantially as described.

This is a gang-plow, so constructed and operated that the several plows can be raised and lowered without the necessity of lifting a heavy mass of wood and metal. The invention also relates to the attachment of the plows to the beam or frame.

87,758.—Improved Wheel for Carriages. W. H. De Valin, Sacramento, Cal.:

1. I claim uniting the rim or tire to the hub or axle by means of a series of straps or flat bars of wrought iron, each bent at the middle where it is attached to the rim, and having its diverging ends extending thence to the hub or axle to which they are united in the manner set forth.

2. The combinatiou with the elongated hub and the axle upon which it is mounted, of the rim or tire, and a series of wrought iron straps or flat bars, for steadying and bracing the said rim, and for holding the same to the hub, the whole being arranged in the manner set forth.

81,762.—Improved Revolving Furnace for Roasting Ores.—Frederick Ernst, San Francisco, Cal.:

1. I claim the hearth D, revolving between the inner and outer walls B, C, of the furnace, with the circular rack F, and flange G, operating in the grooves of the rollers H, H, substantially as described.

2. The discharging apparatus operating transversely across the furnace above the rotating hearth, and consisting of the scrapers N, N, attached to the endless chain N′, operated by the wheels, substantially as described.

3. The construction of the hearth D, with the circular flanges E, E, so as to retain the ore upon the surface of the hearth, and the stirrer M, or its equivaleut, to turn the ore as the hearth revolves, the whole constructed and operated substantially as described.

4. The dampers u, u′, and sliding plate S, arranged to be operated substantially as and for the purposes described.

5. In revolving furnaces, carrying the ore in one direction on the hearth, while the heat, flame and gases pass in an opposite direction, substantially as described.

This is a mechanical furnace, intended to do away with the necessity of stirring the charge by hand. The ore is brought into a hopper above the furnace by means of elevators, and when sufficiently roasted is discharged by revolving scrapers.

81,789.—Improved Escapement.—Wm. C. Kellum, San Francisco, Cal.:

1. I claim tho escape wheel C, having escape teeth either on the side or rim, and the notched impulse rollers D and D′, above and below, constructed and operating substantially as and for the purpose herein described.

2. I claim the detent lever F, with the adjustable double-headed screw c, c′, or its equivalent, locking each tooth of the escape wheel twice at each revolution, either by spring or gravitation, substantially as herein described.

3. I claim the point d, on the arm G, and the point e, on the roller D, for unlocking, substantially as herein described.

This is one of several improvements on the movements of a watch or clock, which have been patented by Mr. Kellum, a dentist of this city, who has shown himself to be quite as much of a horologist as an odontologist.

Short sighted Policy—To injure your sight by reading at night, when a good fit from Muller's Spectacle Emporium, 205 Montgomery street, would save the eye for years. *

[From the Mechanics' Fair Daily Press.]

Comparisons with other Fairs.

Since the great London World's Fair of 1851, exhibitions of the same character have been in vogue everywhere. It has struck the vein of the times; and it is pretty certain that in centuries hence the histories will refer to this as the characteristic age when nationalties and distances, and the discord of Babel's tongues ceased to be a barrier to the unity of humanity, and when all mankind, civilized and semi-civilized, met for the first time on such cordial terms, in crystal temples of iron and glass, of such size and grandeur as nothing can convey to the mind but a sight of Sydenham palace itself, or a comparison with Miltou's imaginative edifices of the skies—when there was inangurated at the same time, as a kind of paleontological mark to perpetuate forever the associations of our age, a new and original style of architecture, which would seem to have heen an impossibility but for its conuection with some such characteristic development in the career of nations,—a temple in which the industries of the world were joined together to enthrone and glorify not the Queen, nor the Emperor, but the principle of man's equality, the sovereignty of universal common interests, and the godlike character of progress in invention. The subsequent London Exhibitions and the Paris *Exposition Universelle*, were but repetitions, with additional *eclat*. Local exhibitions, such as the Scandinavian Fair at Stockholm, in 1867, the American Institute Fair of 1867, the recent Australian Colonial Exhibitions, and the California Mechanics' Institute Fair of 1868, are but individual chapters of the book.

The surveyor and navigator locate their position relative to the rest of the world by bringing themselves in comparison with at least two other known situations, agrecably to the principles and conditions of trigonometry ; but progress, being a comparison of the past with the present, in order to ascertain our position at any given time in the future we shall only have to avail ourselves of the logbook, and the sailor's simple art of dead reckoning.

Hallidie's Wire Works.—A fuller description than we have given of these works would be found interesting to the general reader, as wire rope and wire cord made of different metals and alloys, have become so universal in their application, of late years. Iron and steel wire rope, flat and round, are now made for hoisting from mining shafts and inclines, for ferry ropes, guy ropes for derricks, derrick fall ropes, conveying power to distances, signal ropes, sash and picture cord, fencing strand, suspension bridges, etc.

The machinery which is used to make wire rope is ingenious, but not very complicated. Visitors at the Fair have seen one of these machines at work frequently in the afternoon and evening, turniug out wire rope and cords of a quality so flexible as to answer where almost any ordinary rope would be used,—as for the snspension of window sashes,—and they are incomparably more durable. Wire rope has been consumed to a very large extent too for the construction of suspension bridges in the more mountainous portions of the State, and across the deep gullies of the coast, roads and trails. In such localities the suspension bridge is found to be the most economical, at the same time that it is the most durable bridge that can be constructed.

STOCK CERTIFICATES,
STOCK TRANSFER JOURNALS,

Silver Chlorination.

Messrs. Kustel & Hoffman have adapted chlorination also to silver ores, by a combination of the Plattner & Platera wet processes—dissolving the chloride of gold out first by means of hot water, and the chloride of silver afterwards by a solution of hypo-sulphite of soda.

This adaptation will be found especially useful where the ores contain both gold and silver. The method of procedure is thus described:

The ore having been roasted, is treated by the Plattner gold chlorination process, as used in numerous chlorination works in this State. The powder is moistened and put into a covered wooden tub or vat, into the bottom of which chlorine gas, made by mixing sulphuric acid, black oxide of manganese and common salt, is forced. This chlorine unites with the gold and forms a chloride which is soluble, and is leached out by letting water run through the ore. Sulphate of iron is added to the solution of chloride of gold, and the chlorine leaves the gold, which then being reduced to a metallic state, becomes insoluble, and falls to the bottom as a fine, dark-purple powder, which has only to be melted to turn into a bright yellow bar. Mr. Kustel has found that by drawing off the chlorine from one vat to another, instead of letting it escape after each change, as is the general custom, he can chlorinize a ton of silver ore with three pounds of manganese instead of ten pounds, the usual quantity in gold chlorination, and there is a proportionate saving of acid and salt. If there is any copper in the ore, it is leached out with the gold, and may be precipitated from the solution by throwing in pieces of iron.

The silver in the roasted ore is not soluble in cold water, and although it can be leached out by a hot solution of salt, yet as sixty-eight pounds of salt are required for one of silver, that process is so unprofitable that it is not used on this coast at all, and only on matt in Europe. But it can be leached out by a solntion of hypo-sulphite of soda, which is employed by Mr. Kustel, three-quarters of a pound of the salt being dissolved in a cubic foot of water, and two feet and two-thirds of the solution being employed to leach out a pound of silver. In leaching, the solution should stand six inches over the pulverized ore, which may be two feet deep, and be dripping down constantly, not less than twelve nor more than twenty-four hours. After leaching, the solution is clear, and contains oxide of silver in chemical combination with hypo-sulphite of soda. A solution of sulphide of sodium is poured in to precipitate the silver as a sulphide, which is drained clear of water in a strong canvas bag, dried, pressed, exposed to a low red heat to drive off the sulphur, and then melted with iron in a crucible. The bar consists of three-fourths silver and one-fourth matt, and the latter splits off when the hot bar is thrown into water. The matt contains from four to six per cent. of silver, and is crushed and roasted with the next lot of ore.

Several experiments tried on four tons of ore from the Rising Star mine at Owyhee, showed yields varying from three to six per cent. less than the fire assay, and the bullion, which is .700 fine when amalgamated in the barrel, was .957 fine by the Kustel process.

British Columbia.—The State Telegraph gives us the following interesting item from this place :

Victoria, Sept. 17th.—Considerable excitement exists here on account of the discovery of gold on the banks of Wolf Creek, twenty miles distant from this city, and three miles from Luck river. Two men arrived in town on Saturday with $97 in coarse gold, which they had taken out in one week. The largest piece is valued at $27, and is said to be superior in quality to that of Cariboo. Owing to the scarcity of water, very little work can be done at present. but it is expected that as soon as water can he obtained, good paying diggings will be found.

Another addition to the varied attractions and accommodations afforded the pleasure-seeking public at Woodward's Gardens, has been recently made in way of a new large restaurant in connection with the saloon. *

The Mining and Scientific Press comes to us this week in a new dress throughout, much improving its appearance. The Press is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

Weekly Stock Circular.

By Associated Brokers of the S F. Stock and Exchange Board.

SAN FRANCISCO, September 19, 1868.

Financial.

Business is quite brisk in this city, and, as a consequence, there is a much improved demand for money. The funds in our savings and loan institutions have been drawn upon with more than ordinary requisition for the purpose of carrying on legitimate transactions. Deposits are not so free nor so large, the money finding outside investments. Our bullion market is well supplied, and, notwithstanding the increased activity in the money market, bank rates remain at 1@1¼ ₱ cent. per month. Outside loans command 1½ per cent. per month. Our very large grain crops are being steadily moved, but the process makes no marked impression upon our financial condition. Gold bars are abundant at 870@880, and are being shipped by Chinese merchants in preference to Mexican dollars. The reason for this change has not yet transpired, but is undoubtedly due to some information exclusively possessed by that class of our business men.

On the 5th of September the North American Steamship Company's steamer Nebraska sailed for Panama with $300,000 in gold, shipped by the Sub-Treasurer. This makes $7,500,000 sent by that officer so far this year, being $2,000,000 more than were shipped in all of last year. There either is or is not some reason why these shipments are made furtively; if there is reason, Californians desire to know what it is, and if there is no reason, they demand that the seal of secresy be lifted.

The Mechanics' Industrial Fair has closed its regular course of exhibition, and has been continued in aid of our several benevolent institutions, all of which have received substantial tokens of the liberality which animates our people. Thousands of dollars will be distributed to the dependent in this chaste and handsome manner.

From the Auditor's annual report for the City and County of San Francisco, ending June 30, 1868, we extract the following in regard to taxes on premiums of insurance collected for the State of California:

FIRE AND MARINE INSURANCE.

Name of Company.	Gross premiums coin or its equivalent.	Tax, two per cent. Coin.
Ætna	$26,011 82	$320 23
British and Foreign	20,406 00	408 12

Total Tax collected on Premiums of Insurance as per Treasurer's State Account and above Tables, $19,438 38.

City Stocks.

Since our last similar reference the sales of miscellaneous stocks in the Board were as follows: Spring Valley Water, on the 12th instant, at $66 25, and on the 18th at $66. North Beach and Mission Railroad stock was in the market at $72 per share. Considerable sales of Legal Tender Notes were made at 70 cents, while U. S. 5-20's commanded 76¾ cents. The California Steam Navigation Co. paid its usual dividend of 1½ per cent. on the 15th instant.

The Funded Debt of the City and County of San Francisco stood as follows at the close of the fiscal year, June 30, 1868:

City Bonds of 1851, 10 per cent., due May 1, 1871	$1,189,200
City Bonds of 1855, 5 per cent., due January 1, 1875	236,000
City and County Bonds of 1858, 6 per cent., due January 1, 1888	1,078,500
City and County Bonds of 1860 (School), 10 per cent., due July 1, 1870	54,500
City and County Bonds of 1861 (School), 10 per cent., due July 1, 1870	16,000
City and County Bonds of 1862-3 (San Francisco and San José Railroad), 7 per cent., due at various dates and in various amounts	257,500
City and County Bonds of 1863 (Judgment), 7 per cent., due October 1, 1883	801,500
City and County Bonds of 1864 (Judgment), 7 per cent., due June 1, 1884	28,000
City and County Bonds of 1864 (Central Pacific Railroad), 7 per cent., due July 1, 1894	400,000
City and County Bonds of 1865 (Western Pacific Railroad), 7 per cent., due May 1, 1895	250,000
City and County Bonds of 1868-7 (School), 7 per cent., due April 1, 1881	213,000
Total amount of Bonds outstanding	$4,554,200
Amount of annual interest on above indebtedness	$343,440
Amount of annual Sinking Fund	$163,000

Mining Share Market.

During the week under review, transactions in the Board have been less in volume than for some time past, the aggregate daily sales averaging about $300,000, in both open and regular sessions. Under the present depressed condition of the market time sellers have a marked advantage, reaping the profits of the fall, while others are suffering to no small extent. The tightening of the local money market has not a little to do with this condition of affairs, since the plethora of money so long prevalent here now finds other channels, and at a more remunerative rate of interest than has latterly been obtained. We cannot say that the claims on the Comstock lode present a more promising future than they did last week, however the fall in prices is not so much governed by their present condition as by the operations of speculative dealers. Our opinion is that those who purchased at the decline will gain handsome profits on their investments.

IMPERIAL—sold somewhat more freely, declining from $105 to $93, then selling at $97, and closing at $95. On the 15th inst., the Imperial-Empire shaft had been carried to a depth of 65 feet below the 900 level. The raise from the 900 level is up 98 feet, and the main drift, since the first of the month, has been opened 31 feet, the face now showing soft quartz. The winze from the 700 level of the Alta mine is down 85 feet. No change is reported in the ores on the different levels of this mine. They are hoisting 115 tons of ore daily from the Alta and 10 tons from the Holmes mine. For September account the hullion receipts foot up $13,400 against $10,100 same time in August.

SAVAGE—was active at the close at an advance, opening at $85, dropping to $77, rising to $92, and closing at $83. Heretofore we have always been privileged to read the weekly report of the superintendent of this mine, giving extracts from the same for the information of stockholders who reside at a distance, who cannot visit the office for this purpose, as well as those who desire to invest in the same, but this week and henceforth we are interdicted from doing so.

CROWN POINT—was in the market to a large extent at the decline, receding from $52 50 to $38, improving to $48, and closing at $45. We have nothing of importance from this mine. The recent break in the machinery has been mended, and all is again in good running order. The total receipts for August account have been augmented to $132,122.

KENTUCK—dropped from $360 to $250, rose to $300, and closed at $298. The receipts of bullion for August and September compare as follows:

To September 16th	$43,162 52
To August 16th	36,158 13
Gain in favor of September	$7,004 39

AMADOR—sold at $237 60@240. The first clean-up for September amounted to about $23,000. A dividend of $5 per share is payable now....CONFIDENCE has not been in the market during the past week. Bullion receipts to date for September account, $7,150....GOLD HILL QUARTZ was not sold in the Board during the week. Receipts of hullion so far during September, $3,821.

HALE & NORCROSS—was less active than last week, selling within a range of $54@45, then at $51 50, and closing at $47 50. From the Superintendent's letter we learn that "in the cross-drift west there is no change for the better; considerable quartz, but no ore. In the cross-drift south there are some spots of ore, but no decided improvements yet, although the quartz looks better. In the first and second raises north the ore is about four feet wide, and there is some improvement in the quality. In the drift running south, on the east wall from the last cross-cut, we have about four feet of ore."

CHOLLAR-POTOSI—declined from $150 to $127 50, advanced to $143, and closed at $137. During the week ending September 11th extracted 820 tons of ore from the New Bine Wing stope against 1,004 tons the previous week. Since the weekly report of the 4th inst. a considerable body of ore has been developed at the north end of this stope. As one drift only has been carried through it the extent of it is unknown. Drifts and faces to the southwest are all in ore that will be extracted for milling. During the week under review the incline has been carried to a further depth of 17 feet, and 47 feet have been added to the drift on the 1,100 level, which is now running through porphyry, clay and a small amount of dark quartz.

GOULD & CURRY—sold at $82 50@95, and closed at $90. During the week ending on the 13th inst. the Bonner shaft has been sunk 9 feet, the material extracted being of a similar character to that of last week, with a little more clay. Considerable ore continues to be extracted from the croppings.

OVERMAN—declined from $85 to $67, rose to $82 60, and closed at $77. They continue to raise ore from the 600 level, and the developments are as favorable as last reported. In going south on the 400 level they met with encouraging prospects, and as soon as the connection is made with the 500 level of the Uncle Sam works they will be able to extract ore from that part of the mine. The 300 level gives a daily supply of 50 to 65 tons. For August the bullion receipts amounted to $28,000. On the 13th of the present month $2,816, and on the 14th $3,744 in bullion were sent forward.

ALPHA—fell from $50 to $35, then sold at $40, and closed at $39. A letter of the 15th says the incline is sunk at the rate of four feet per day. They commenced shipping ore, extracted from the 600 and 250 levels, to the Swansea mill, average assays of 23 tons on the 14th showing $43 25 to the ton....OPHIR sold at $18. On the 16th the shaft was 434 feet in depth.....The annual meeting of the SEGREGATED BELCHER CO. will be held on the 6th of October.....The annual meeting of the NORTH STAR CO. will be held on the 25th inst.

NEW HAMPSHIRE MINES.—In an address before the New Hampshire Legislature, Prof. Hitchcock said there was copper enough on Gardner's Mountain in Lyman, in that State, to last the country 200 years. and that the mines would be worked when those of Lake Superior were forsaken. He stated what is perhaps new to most people, that there is now in circulation in the country from $8,500 to $10,000 of New Hampshire gold coined at Philadelphia, and he thinks their mines may be profitably worked, especially by the use of the new material called "Stephens' Flux."

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 11, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore	$15 00	22 per cent. ore	$43 50
13 " "	18 62	23 " "	46 46
14 " "	20	24 " "	49 33
15 " "	23 35	25 " "	52 22
16 " "	26	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	59 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Receipts of the Fair.

Blanks, Blank Mining Books

Constitution and By-Laws

— FOR —

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the **Mining and Scientific Press.**

Orders from the interior faithfully attended.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

WHETHER the scarcity of mining items during the past few weeks can be attributed to the fact that our mines are not paying so well as formerly, or that our exchanges take more interest in political than local mining matters, is a question we have been seriously considering lately. There has certainly been a falling off in our weekly summary, and that too at that particular season when we would naturally expect our exchanges to be overflowing with encouraging reports. Nevada County, always the most flourishing in mining matters, sends us as usual a long list of favorable items, also one or two other counties; but a majority of those from whose papers we are in the habit of clipping largely, come to us meager and frequently entirely innocent of an item to give us hope. We cannot think that our mines are failing, but rather attribute it to a fondness on the part of our cotemporaries to mix up in the filthy pool of politics. Now if this is the case, we object. Keep up your home interests, and politics, always lively enough of itself, will take care of itself. We hope next week to give a more complete summary of mining items.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Sept. 5th: The Globe tunnel is still cutting small veins of quartz, outlying feeders to the main lode, that look well.

We hear still more flattering reports of the recent strike in the Rippon claim. The quartz looks well and they seem to have a large body of it. No test of the ore has yet been heard from.

E. Arnold has sold one half of his interest in 3,000 shares of stock in the Leviathan Co. for $1,000.

Chronicle, Sept. 5th: Work will soon be resumed on the George Washington claim by its new proprietors, who are negotiating with Superintendent Thompson for the crushing of their ore at the Pittsburg mill. One hundred tons of rock are now ready for the mill, and if satisfactory arrangements are perfected, hands will at once be put on the mine under the superintendence of a gentleman from San Francisco.

An amalgamator from Gold Hill will next week commence putting the Pittsburg mill in order for crushing the IXL rock.

Amador County.

Jackson *Ledger*, Sept. 12th: Jones & Co., lately of Grass Valley, are erecting several English buddles for concentrating sulphurets, near the Oneida mill.

Further developments in the Casco mine confirm our former report. Enough has now been discovered to justify the immediate erection of a 20-stamp mill.

The Coney & Bigelow is following up its steady lick and yielding its regular bricks.

The Spanish mine, on Spanish Gulch, is again turning out some rich specimen rock.

The Gate mine, owned by Dr. Sharp & Co., is being sunk deeper with fair prospects.

At Sutter Creek, the mines are in the usual prosperous condition. It is said that the Mahoney is yielding unusually good, and that the Amador Co. contemplate sinking the two principal shafts still deeper.

At Pine Grove, the contractors on the Kendall have completed a 20-foot drift and are on another. Some excellent rock was found. Another 50 feet has been completed on the Vaughn mine tunnel, but the chimney not yet reached. The Sorroceo's "Italian" and Grass Valley mines are reported good as usual.

Young & Sorroceo Bros., of Volcano, cleaned up their hydraulic claim last week, after a run of 70 days, and the result was a yield of $5,000.

The owners of the Cosumnes copper mines have put up a smelting furnace, and are now working low grades of ore that has accumulated at their mine. The result, so far, has been very satisfactory.

On Tuesday last the new Kennedy 20-stamp mill was set in motion. Everything worked satisfactorily.

Calaveras County.

Mokelumne Hill *Chronicle*, Sept. 12th: Clark & Dudley, proprietors of the celebrated Hie Jacet claim, are evincing an energy unparalleled in its development. One day's labor has been performed during the past month, with the most satisfactory result. The motive power of the machinery employed upon the mine is conveyed to the claim in a bottle.

[How often does said *motive power* require the aid of said bottle?—EDS. PRESS.]

The Lower Rich Gulch correspondent writes: The additional battery of the Palomo mill is completed and commenced crushing on Tuesday the 8th inst. It is a most admirable piece of machinery. The sulphuret works are progressing towards completion.

Alexander & Co. are still going down with their shaft.

Preparations are being made to resume operations on the claim below.

Kern County.

Havilah *Courier*, Sept. 8th: We hear of good placer mines on Kern River, about four miles below Sumner's bridge. The dirt pays remarkably well. The bar is about 1,500 or 2,000 feet in extent; the ground is easily worked and water in abundance is easily obtained. There is no doubt that Kern River in numerous places will pay largely in placer mining.

Mariposa County.

Gazette, Sept. 11th: We learn that the copper mines at Buchanan Hollow, are to be worked with renewed vigor and energy by the gentlemen who have recently taken them in hand. Vilas & Co. have commenced operations on the right basis.

Nevada County.

Transcript, Sept. 9th: For sometime past a Frenchman has been engaged in putting up machinery at Canada Hill, for the purpose of working sulphurets by a new process. The works are now completed, and the experiments on gold sulphurets are said to be more than satisfactory. A gentleman who has visited and examined the works, informs us that they have operated with gold sulphurets and saved five per cent. above the fire assay. They have not yet commenced regular work, but are only experimenting on different kinds of rock. The Superintendent is satisfied with the experiments on gold sulphurets, and is now experimenting on silver sulphurets from the Yellow Jacket mine of Nevada. The parties have expended about $60,000 in fitting up the machinery.

Branbury & Stacy struck a very rich ledge in their claim at Graniteville, several days ago. The lead is three feet wide, and is very rich where they have opened on it in their tunnel. This claim is located near Black & Young's mill. Recently several rich strikes have been made in the vicinity of Graniteville, and there is considerable life in mining matters.

Sept. 10th: M. Jauch and others have located 2,000 feet on a quartz ledge southeast of Badger Hill, in Bridgeport township.

The Brick Top Co. have located 1,100 feet on Green Horn Creek, running back to the summit of Mt. Oro Hill. The claims adjoin those of Barnett & Co. The Brick Top Co. have also located the large ravine running through the southwest corner of their ground for fluming and mining.

O. Crandall arrived here yesterday on his way to Graniteville, to put up a 10-stamp mill on the Jim Crack ledge, owned by Bull & Getchell, of San Francisco.

The 15-stamp mill recently put up on the Eddy mine at French Corral, for the purpose of crushing cement, has been completed and will start up to-day.

The Moore's Flat correspondent writes: The Birchville Co. lately struck the ledge in their tunnel.

Morey & Wooldridge's late discovery promises to be one of the best ledges in the district. The Liberty Co. are running Poquilon's mill on their own rock, and are said to be doing very well.

Atwater & Knotwell cleaned up last week. The run yielded about $6,000.

The old Monogue Co. will have to suspend in a few weeks for want of fall. The claims of J. M. Hickey look first rate.

The Illinois Co's claims look better than they have done for years.

Thomas Dooling is working ground that is acknowledged to be rich. He will soon make a handsome clean up.

The Eagle Co. are about raising their shaft. The Piute Co. are working with fair success.

On Woolsey's Flat, the Boston Consolidation, XIX, and Shultes & Stober are in successful operation and are all doing very well.

Sept. 11th: Ben. Jones & Co. have struck a ledge near Gold Run, which is very rich. The lead runs parallel with the Mohawk, and the gold can be seen all through the rock.

Sept. 15th: The present season has been, on account of the high water in the Yuba, unfavorable to mining upon the bars, but the river is now down to low water mark, and at Rocky Bar and other points mining operations are resumed with fine prospects. Considerable prospecting is being done for quartz on the river above and between Washington and Eureka. The Star Co. are still pegging away in the hope of striking the ledge. At Phelps Hill, rich claims were recently struck, and at Gold Hill this side of Washington. We understand the companies at work are doing first rate.

Gazette, Sept. 8th: Charles Phelps, who has for three years past been running a tunnel at Phelps' Hill in search of a gravel channel, about six weeks ago struck excellent gravel. The gold is coarse, many of the pieces weighing a dollar or more, and one nugget weighing over $50 was picked up.

Grass Valley *Union*, Sept. 9th: "Sailor Jack," and a man known as "Jack of Clubs," a few days ago, struck a rich ledge at Graniteville. The ledge shows free gold in streaks and seams.

EXCELSIOR. — *Transcript*, Sept. 11th: After various trials of the Enterprise ore, Meadow Lake, by the ordinary mill process, the greatest yield obtained was five ounces out of 20 tons, and 160 pounds of quicksilver was lost. The Enterprise men resorted to the "Hagan superheated steam process," and after the first trial obtained 16 48-100th ounces from 20 tons of the same grade of rock, the gold being refined and worth $20 an ounce.

Some of the mines in Meadow Lake are being worked with good success. Lately the Empire Co. had 30 tons of quartz crushed at the California mill, which averaged $20 per ton in free gold, and it is supposed the yield of sulphurets will double the amount. The Mohawk and Montreal are taking out splendid rock in immense quantity. The Independent and U. S. Grant companies are also obtaining excellent rock.

Plumas County.

Quincy *National*, Sept. 10th: The miners on Rush Creek are enjoying a season of prosperity, and have flattering prospects for the future. Roedde & Co., below Holme's Hole, have been doing well lately—making an average of half an ounce per day to the hand. Serrin & Brown are, as usual, making money, and their claim will last a lifetime. Scherr & Co., whose claim is the upper one on the creek, are making good wages, and have fine prospects ahead. R. Guise is still on Bull Frog, and is taking it out in chunks. He picked up a piece a short time ago, weighing over seven ozs.

Several companies are at work on Mill Creek, and are doing well. Swan & Co. have just got a large water derrick in running order, and will throw the pebbles out of their claim in short order.

Siskiyou County.

Yreka *Union*, Sept. 12th: Mining, which was always the chief business at Scott's Bar, is rapidly being monopolized by the Chinese. So far the present season, no great amount of dust has been taken out. The mining is principally in the river, and is prosecuted by means of wheels, wing-dams, etc. The annual freshet did not visit this spot during the present year, and hence no mining has been done.

ARIZONA.

Prescott *Miner*, Aug. 29th: A correspondent writing from Willow Grove, says: Mr. Wade is rapidly pushing forward the work of putting up his mill, and hopes to be crushing quartz by the first of October. Mr. Otis, of San Francisco, owner of a 10-stamp mill that has been standing idle at El Dorado Cañon for the past two years, is actively engaged in getting out ore from the Teehaticup mine, and putting his mill in condition to work it. Mining operations will soon be resumed in the Sacramento district.

The Wickenburg correspondent says: The mills are turning out bushels of money; everything looks lively.

COLORADO.

Central City *Register*, August 27th says: The Sterling Mill, in Chase Gulch, has been thoroughly refitted and repaired.

Prof. Hill has been working some of the very rich ore taken from the Gilpin County Tunnel. The precise results are not yet known, but from $500 to $1,000, in silver, per ton, will be realized.

The proprietors of the Equator mine, at Georgetown, commenced to ship their first lot of 40 tons of ore to Newark, N. J., to be smelted.

The U. S. Bank lode, in Gold Hill, is reported as looking very promising, and producing more rich ore than ever before.

Yesterday we were shown by T. H. Lowe, of Idaho, some beautiful specimens of native silver from a lode recently discovered near Downieville. It was principally in fine, curly wires, that nearly covered the surface of one of the specimens.

Dr. Seaton has commenced work on his reduction works at Mill City. His mode of working consists in crushing, thoroughly freeing the ores from sulphur, then amalgamating.

Silver ore has been taken out, on Gold Hill, which assays between $7,000 and $8,000 per ton.

The Baker Mining Co., of Georgetown, will heat their furnace for the first time on Monday. It is a reverberatory furnace, with blast attached, and is capable of smelting six tons a day. It is finely constructed. The company have a large quantity of ore on hand, and are taking out an average of 3 tons per day, which, assays show, will average $1,000 per ton. They can at any time increase the supply of this ore to 6 tons, as it is already uncovered. This rich ore has been recently struck in two places, 300 feet apart, and when not mixed with gangue gives the assays reported a few days ago. In one place the rich ore struck is 170 feet from the surface; another is at the grass roots. The company have excavated since last Fall 800 feet of shafts and drifts. In the 170-foot shaft there is a body of ore 20 inches thick. The Brown Co.'s furnace will be ready to heat up a few days later. The average working results from its ores give $300 per ton from the upper drift, and $400 from the lower; $15,000 have already been shipped from this mine this Summer.

The Baker Co. recently commenced to drive a cross-cut, and have now struck a vein of ore 10 inches wide, which yields an average assay of $1,824 per ton; the highest assay made from it is $16,280 per ton. The ore is ruby silver and brittle silver, or stephanite.

Prof. Silliman, of Yale College, is here, examining the geology of Colorado, and collecting specimens for the cabinet of his college.

Denver *News*, August 26th: Silver ore has been found at Gold Hill which assays $7,000 to $8,000 a ton.

A dispatch dated to-day, at Trinidad, says: "Good mines struck within a mile of town; nuggets large as beans."

Sept. 2d: Four hundred ft. on the Perrin lode was recently sold in Central for $15,000.

The Five-Twenty mill at Oro City started on Monday last....Gulch mining is prosperous, the shipments of dust larger than heretofore this season. A new and valuable lode has been discovered by Captain Wetmore on the mountain just above Dayton.

Central City *Herald*, Sept. 2d: The Awanda lode, on Leaveuworth Mountain, is turning out to be one of the largest mineral veins in that locality, showing about two feet of ore....While at Georgetown the other day we saw 250 sacks of Terrible ore neatly put up and marked for the New Jersey Smelting Works. The ore is crushed and dressed at the mine, and from 50 to 75 lbs. put in each sack. The owners of the Equator are also shipping ore ...Dr. Scaton is running the mill formerly managed by Mr. McIntyre, of Mill City. We saw about a hatfull of amalgam there the other day....J. W. Nesmith has let the contract for the erection of a 20-stamp water mill, opposite the Tiger mill, on North Clear Creek....The last run made from Dead Broke ore, which was put through one section of the Black Hawk Co's 60-stamp mill, yielded $200 per cord, gold....The Pleasant Valley Co's claim on Russell, panned out, last week 111 ounces, gold, currency valuation $2,700....Richard Glennan is working claim No. 2 East, on the Mack lode, Gregory district, and taking out good pay. The ore is being crushed in the Arighi mill, above Black Hawk....Miller & Haeh are working the patch claims north of the German lode. It pays them about $7 per day to the man....John Bennet showed us, last evening, a fine lot of specimens of surface quartz from a lode he discovered yesterday in Lake Gulch. Present indications are that he has struck a big thing....The New York Co's 35-stamp water mill below Black Hawk, is being run this week on ore from three different lodes, situated in Illinois Central district, the most prominent of which is the Dunnegan.... A. C. Johnson is working two shafts on the Golden Eagle lode, Lake district. He is running the ore in the Cullison water mill at Missouri City. It is yielding at the rate of $270 per cord.

Borham Miller & Co. have reached a depth of 90 ft. on claim No. 1 East, on the Bates or Hunter lode. At that depth they have a fine body of ore in sight. They keep a portion of the New York Co's mill constantly employed crushing for them.

From a cord of ore, mixed with wall-rock, from the Illinois extension lode, run in the Whitcomb mill, recently, $187 gold was taken out.

Georgetown *Miner*, Sept. 2d: Huepeden, Walters & Co. have shipped, since our last

issue, 2,768 ozs. of silver bullion, coin value $2,734.79. More bullion is being produced by these works at the present time than ever before since their erection.... The Marshall tunnel is progressing finely.... Extensive developments are being made on the Astor lode, situated on the summit of Democrat Mountain. There is now out 150 tons of second class ore, that will probably yield $80 per ton, and 20 tons of first-class. There has been taken from the shaft and treated, one ton of ore that gave an average assay of 611 ozs., and eight tons that assayed 200 ozs.

DACOTAH.

Salt Lake *Telegraph*, Sept. 1st: Cozer, Roberts & Co's mill, at Sweetwater, made another clean up yesterday. One hundred and eighty tons of rock from the Miners' Delight ledge were crushed, realizing $13,000, being over $120 per ton. The first lot of rock crushed yielded a very fair quantity of gold, but this last lot claps the climax.

That little mill is doing splendid work, and will do more to develop Sweetwater than the reports of 10,000 hummers and deadheads.

IDAHO.

Boise *World*, Sept. 5th: The French Co. have finished their bedrock flume in Piko's Fork of Crooked river, upon which they have worked two years. At Banner City there are about 40 men engaged. Lester & Co. have completed two fine arastras, which are to be operated by an overshot wheel of 30 ft. diameter. Mr. Ankanm is superintending these arastras, and they will soon be engaged in crushing ores from the Banner ledge. Among those which prospect very richly is the Wolverine.

River bed mining at Deadwood Basin has resulted in a failure. The gold product was far below expectations, and not enough to pay even low wages. The hill, bar, gulch and other claims still hold out well, and good diggings will be afforded for many years. At present only about 40 miners are engaged in the Basin, and they are all making from wages to good pay.

Owyhee *Avalanche*, Sept. 5th: Wells, Fargo & Co. shipped from this city to San Francisco during the month of August, silver bullion to the amount of $133,152.

Another quartz discovery has been made in Flint, supposed to be an extension of the Rising Star.

Work progresses briskly on the Surplus Oro Fino. Fry, Clark & Basford have commenced work on the Little Giant, a few yard east of the Oro Fino. Some rich gold-bearing ore is being taken out.

Little work is now being done on the Ida Elmore, but operations will be resumed with redoubled vigor as soon as the new hoisting works are ready for use.

The Golden Chariot still "pursues the even tenor of its way." Sinker mill is kept running on rich ore. Everything at the Poorman wears an active, business air.

MONTANA.

Helena *Post*, Sept. 4th: On Cañon Creek, near the mouth of Tenderfoot Gulch, Crary & Co. cleaned up, without the aid of quicksilver, night before last, after two days' run from pay gravel, in dimensions ten by six feet and four feet deep, $500 in fine, clean scale gold, each piece weighing from 50 cents to $4, and free of quartz. There are now about 50 men at work in that vicinity, and the camp is proving itself to be one of the richest in this section of the country. Only four feet of stripping is required to reach the pay dirt.

Active mining operations are being prosecuted in the upper portion of Last Chance Gulch. On No. 9, above discovery, $17 per day to the man is being taken out, and still richer deposits of gold are believed to exist in No. 10, where a horse whim is in process of erection.

Several hundred dollars were cleaned up last week on the old bar near Boulder Crossing. In the second drain ditch, Lincoln Gulch, four claims have already been opened and are paying from $9 to $14 per day to the hand. The lower drain ditch is being pushed rapidly forward toward completion. A depth of 24 ft. has been reached, and it is expected that bedrock will be struck within four or five weeks. The drain ditch in Keep Cool, is to again receive attention, and rich results are expected. On claims Nos. 5 and 6, in Lincoln Gulch, a dividend of $250 each, above expenses, for one week's run, was recently declared. Some 25 workmen are employed in the claim.

The largest brick ever manufactured in the United States, outside of California, has been on exhibition at F. Bohm's. It was smelted for Bohm & Auh, and was worth $28,500.

The Virginia *Democrat* says: Radersburg anticipates having four quartz mills this fall. Walton & Barkley are about bringing in a new ditch, upon mines in the vicinity of the town mentioned. This ditch will supply water to 500 acres of ground that will pay from $4 to $25 per day to the hand.

The Deer Lodge *Independent* says: Prouse & Co. recently sold their mining property at Gold Creek, consisting of two water ditches, several mining claims, etc., to the Rock Creek Ditch Co., for $10,000 in gold. ....The James Stuart mill is to commence this week to crush custom rock....The Hanauer mill at Cable is soon to commence work on custom rock.

NEVADA.

Humboldt.

Unionville *Register*, Sept. 12th: From James Dunn, who is just in from Battle Mountain, we learn that Atchison's mill will be in operation in about 10 days; also that Atchison has made a fortunate strike in the development of his mine at that place. It promises to surpass the famous Little Giant belonging to McBeth & Co.

Mr. Munson who has been East organizing a company for the development of his mines in Gold Run district, comes back, prepared to erect a large mill in the vicinity of the mines, and contemplates going immediately to work on his mines at that place.

Both our mills are now kept running day and night, reducing ores from the Manitowoc and Arizona mines. A large force of miners are engaged in taking out ore.

S. R. D. Stewart went to San Francisco Monday last, to purchase a new mill for this place.

Winnemucca *Argent*, Sept. 10th: Holt & Elzy have moved the machinery of Holt's Winnemucca mill to this district and have men excavating a foundation for the new structure.

Reese River.

Austin *Reveille*, Sept. 10th: The mill of the Old Dominion Co. at Hot Creek, which was burned last winter, has been rebuilt, and is now successfully reducing ore from that district as well as from Reveille and Morey.

Sept. 11th: Yesterday afternoon seven bars of bullion, valued at $8,057.59, were brought into this city. They are the product of White Pine ore reduced at the Centenary mill in the district of Newark.

It is reported that a ledge of rich ore was struck in the Oregon shaft of the Manhattan Co. yesterday. It is presumed that the ledge cut is the North Star.

Nevada *Gazette*, Sept. 9th: We saw yesterday at the Union Hotel Saloon a couple of fine specimens of silver ore recently brought from Reese River by H. L. Dawley. One is from the North Star mine, and though not remarkably rich, is an elegant specimen for a cabinet. The other specimen came from White Pine, and though not particularly beautiful to the eye, is very rich. It is of a light greenish cast and assays at the rate of over $23,000 a ton. It is so rich that it cannot be crushed, but flattens out when hammered, and the silver can only be extracted by smelting the ore.

Grass Valley *National*, Sept. 9th: From a private letter dated Austin, August 24th, directed to a well known citizen of this town, from his brother, we have the following concerning the new mines in White Pine district, Nevada. From the Keystone ledge, or rather deposit, which is immensely rich, the owners have brought in and had worked here, about 37 tons of ore, which has netted them nearly $1,000 per ton. They have also about 50 tons equally good on the way in, and this is their second class. First class is estimated to go from $8,000 to $10,000 per ton, and I believe they have now 15 to 20 tons of it. The Eberhart ledge or deposit, close by the Keystone, is equally good. It is all deposits in limestone. They get a great deal of good ore from other deposits in the neighborhood. It will soon be overdone like everything else.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

NEW MEXICO.

The Mazatlan correspondent of the *Times* of this city, says: The mines are in a little better condition than a few months ago. Several miners are doing well in this State. I speak of foreign miners—the Mexican miners almost always do well. The Tayo, at Rosario, is probably the best at present; the Cosala S. M. Co., at Cosala, is doing well; and the Alcaran, at Copala, and the mines at S. Dimas and Ventanas very well. These are silver mines. There are no gold mines in this State yet known, that would pay to work. Those that have been worked at Cohorbatito, Arapahoe, Metates, Ahoys, and Cesala, proved very well on the surface, but worthless at a very little depth.

OREGON.

Dalles *Mountaineer*, Aug. 28th: The Cañon City correspondent writes: Within the past few days several of our prospecting parties have returned, and from their downcast looks it is quite evident that success did not crown their efforts; and the rich gold fields that lay around Stein's Mountain faded from their view, and nothing was to be found but vast sage plains. They all join in pronouncing Stein's Mountain a humbug. From Malheur nothing definite is yet known. The reports are so conflicting that it is impossible to arrive at anything conclusive, yet it is believed good diggings exist in that locality. Rumor says that rich diggings has been struck on Selvage and Crooked rivers.

The new mines recently struck on Little Pine Creek, are creating a sensation.

At Marysville there has been some very profitable runs made this season, which is quite encouraging. Mr. Hare & Co. cleaned up after seven days' run—working but 11 men—near $12,000; Thompson & Co. have also been quite as successful.

The Roseburg *Ensign* says: Jesse N. Barker has presented us with the first silver brick taken from the Bohemian mine. It is a nice specimen of pure shining silver, taken from quartz first roasted, then crushed and separated from the rock with quicksilver. The yield, in accordance with this assay, would be $1,600 to the ton, and is easily gathered and saved. There is no doubt now but that Bohemia is one of the richest districts yet discovered on this coast. We were also shown by him some fine lumps of gold from the same rock.

UTAH.

A correspondent of the Belmont *Reporter* writing from Bingham Cañon, under date of Aug. 18th, says: Times are improving here very much, although there are not so many miners here as there were a few months since, yet those that are here have good claims, and know how to work, and, consequently, are taking out considerable gold. One person, who is working just above Spencer & Co's claim, took out, last week, nearly $500. He has four men employed, and is working a drift claim.

Resources and Position of Alaska.

Several Congressional documents have reached us, containing valuable information on this subject. The most important is a geographical and geological report by Prof. Wm. P. Blake, who, at the expiration of his engagement with the Tycoon's Government in 1863, accompanied a Russian expedition to that coast, explored many of the harbors, and made a survey of Stickeen river. It contains a map of that river, and some illustrations of glaciers.

The report furthermore describes the coast of Alaska, in the vicinity of Sitka; the mineral resources, comprising coal, copper, gold and platina; the ice and glaciers along the coast; the Stickeen river country; currents and navigation; the geology and mineralogy of the country; the climate; fish and game; and concludes with a reproduction of his journal up Stickeen river, to which are appended a tabular exhibit of the fur productions of Russian America, and a list of Indian geographical words that will be found of use to coasters.

N. P. Banks, in his speech on the purchase of Alaska, said:

It is at least probable, if not certain, that if the war in which we were recently engaged there had been a failure of our Government promptly to maintain its power and position, Russian America might in the end have gone to England, Mexico to France, and the Pacific coast would have been divided between them, as events might have allowed their great objects to have been accomplished. * * * Gov. Simpson said in reference to this strip of Russian America which had been leased by the Hudson Bay Company from the Russian Government, that without it the British possessions on the Pacific would be comparatively worthless. It was leased upon that view by the Russian Government out of regard for the English interest on that coast. * * * Napoleon said the art of war should be changed every ten years. Every twenty or thirty years new ideas appear, new principles are announced. The government of the world changes once or twice every century, and the theater of human history is transferred to different parts of the globe in the course of one or two centuries. A change of this character is now dawning upon us. Hitherto the Atlantic ocean has been the theater o. its power and its triumphs. It has been the great ocean of the world. Those on one side and those on the other made it whatever they chose. They gave to it law. It was in fact an European sea. The control of the world hitherto has been in European hands, because Europe was the sovereign of this great sea. So long as the Atlantic ocean controls the destinies of men, so long the destiny and the idea of that control will be European, and so long as it is European it will stand in the way of the progress of civilization and bar the movements of the people to the acquisition or the resumption of the power that by the laws of nature belongs to them. How can it be changed? By intervention, by war? No sir. The providence of God arranges other means for the control of the great families of men than such methods of violence. The changes in the theater of operation point out new fields, new pastures, green and beautiful, to which the children of creation may go. They come from the Atlantic, and they take their position upon what is called the great ocean of the world—the Pacific ocean. That with the Indian ocean, which is part of the Pacific, so spoken of by geographers, covers one hundred million square miles, and rolls between six hundred million people (Asiatics) on one side and about three hundred million (Americans and Europeans) on the other. That ocean will be the theater of the triumphs of civilization in the future. It is on that line that are to be fought the great battles of the hereafter. It is there that the institutions of this world will be fashioned and its destinies decided. If this transfer is successful, it will no longer be an European civilization or an European destiny that controls us. It will be a higher civilization and a nobler destiny. It may be an American civilization, an American destiny of six hundred million souls. Across that great ocean of the future there is not one that is not a friend of this country, nor a government that is not willing to strike hands with us in any just movement for any just purpose. Russia, China, Japan, India—so far as she is left to herself—even Turkey, the whole of these powers have been and are and still may be, even to the end, friendly to us. As for ourselves we have nothing to fear from Europe. In this future and in the presence of these powers Europe loses, as every nation in time loses, her prestige and becomes subordinate to the new powers in the progress of human civilization and the destiny of nations.

Zinc From Missouri.—Missouri has not only her mines of iron ore, her veins and placers of galena extending over some 6,000 square miles of territory, 26,000 square miles of coal area, and croppings of rich copper ore that have been discovered in some fifteen counties; her rich ores of zinc, carbonates and silicates, occupy no subordinate position in her mineral treasures. The time, it seems, has arrived, when ingots of metallic zinc can bear substantial testimony to the opening up of a new industry. The new works are located at Potosi, a short distance from St. Louis. The supply of zinc ores in Missouri is said to be immense. Capital has been successfully invested in them, and we may hope for the development of an industry that will not only make itself felt through the whole country, but also give to the State eventually a prominent position as regards the zinc trade of the world. The Missouri cobalt and nickel mines are still unworked.

Chinamen as Printers.—The Hong Kong *Press and China Mail* are owned and edited by Englishmen, while the compositors, pressmen, mail clerk, etc., are Chinese. There are some twelve or fifteen of them employed in the composition room of the *Press* office, who set six to nine thousand ems per day each. Notwithstanding these compositors set type, not a single one of them understands a word of English, and they have not the faintest idea of what they are placing in type. They set manuscript with as much facility as they do reprint, and but few American printers set type faster, or with less errors. These printers consider themselves well paid when they receive $15 per month.—*Exchange.*

North Shore of Lake Superior.—A new mining corporation has been organized to prosecute work on a gold and silver vein near Encampment Island, on the north shore of Lake Superior, thirty miles northeast of Superior City. A force of miners are at work developing the property under the superintendency of Prof. Eames, late geologist of the State of Minnesota, assisted by Mr. Mayhew, a practical mining superintendent, who was formerly employed by one of the Vermillion gold mines. The vein shows well, being 30 feet in width, N. W. by S. E.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 8, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, Sept. 19, 1868.

Notices to Correspondents.

CHEMICAL GEOLOGY.—We have for some time had in hand, through the favor of his relative, Mr. M. Attwood, of this city, a copy of Mr. David Forbe's lecture on this subject. The space occupied by the description of the various articles exhibited at our Industrial Fair, and that required by the State Fair, has hitherto prevented our inserting tbe same, which we commence *in extenso* this week. There is one expression, however, in Mr. Forbe's lecture which we would like to have explained, if possible, by the time we have completed its re-publication. Mr. Forbes, as one of bis illustrations asks: "I leave it to the (Chemical) Society to decide whether it is uot as correct reasoning to infer hy analogy, that quartz may have crystallized out of a solution of silica in highly acid silicates upon a lowering of temperature, as that the graphite in the specimen on the table before us has crystallized out of *a solution of carbon from cast iron, upon its temperature being lowered, which we know to be the fact.*" We are aware that if we inclose diamond dust or charcoal between two pieces of pure iron, and subsequently subject them to a very elevated temperature, the diamond powder or charcoal will disappear, having become united with the iron to form a carburet of that metal, which would be either steel or cast irou, according to the quantity of carhon ahsorbed by that metal. The phenomenon is well known in steel making, under the somewhat ambiguous term "cementation." In the union of iron and carbon just noticed, however, we have never seen it demonstrated, that either prior or subsequent to such combination, the carhon in any case becomes liquefied. Steel or cast iron can be fused, but in sucb cases, the carbon present is in the form of a compound carburet of iron.

BORER.—A NEW EXPLOSIVE AGENT.—"Dynamite is the name of a new explosive agent, consisting of porous silica, saturated with nitro-glycerine, which is just now attracting the atteution of those who are interested in quarrying and mining operations. A series of experiments, which took place the other day in Lanarkshire, is said to have proved that the exploding of dynamite is about tbree times greater than that of gun cotton, or some twelve times greater than that of gunpowder. A couple of tablespoonfuls laid quite loose on a thick beam proved sufficient. when fired, to break the timber right across, and project one of the fragments to a considerable distance. A charge of six pouuds exploded in a borizontal bore brought down about 4,000 cubic feet of whinstone rock. In another experiment a block of wrought iron, measuring nine inches by eight, was placed vertically in the ground, and a quantity of dynamite, covered only with loose rubbish, exploded on its upper surface. The result was to couvert what had been a convex surface into a concave one, the mass of iron being at the same time split in several places. Although dynamite contains 76 per cent. of nitro-glycerine, it is said to be as safe as gunpowder against explosion by concussion." The preceding, is quoted from an English paper, which does not explaiu what it meaus by porous silica. In other papers and journals, we have seen pulverized vegetable matter named in place of silica. We believe Cutch and Gambia have been patented for this purpose.

Corrosion of Iron.

An important economical consideration in the selection of an article so costly as iron for underground mining and hydraulic purposes, where it is exposed to the corrosive influences of water containing acid or alkaline ingredients, is its duration against oxidation; which is known by all who have had any experience in mining to vary in an extraordinary degree, depending firstly on the kind of water or gases to which it is exposed, and secoudly upon the character of the iron which is used for such purposes.

Formerly it was assumed that iron was subject to a rapid corrosion when immersed in water, or exposed to the alternations of the water and the atmosphere, and the every day experience of constructors seemed to confirm tbis opinion. Cast iron water pipes in city streets are frequently fouud greatly corroded; and cannon shot, immersed in sea water for half a century, and sometimes less, have been found with the mass of the metal entirely changed from iron into plumbago, or deeply pitted by oxidation. But frequent very noteworthy exceptions have been observed. The cannon of the Royal George, which had heen submerged half a century, when first taken out were so soft that the metal could he cut with a knife, but immediately hardened on exposure to the air, and were again fired; while some muskets and cannon, sunk in Lake Erie and Ontario, during the war of 1812, were, forty years afterwards, found to he but slightly rusted.

Mallet's well-known experiments in 1810, showed tbat iron exposed to water holding air in combination corrodes on the surface either uniformly or in places, by rust or by the conversion of the iron into plumbago, and that corrosion depeuds upon the want of homogencousness of the surface, or in its density or hardness, or in the combination of the carbon with the iron.

This subject was very thoroughly discussed by some of the most eminent engineers of the London Engineer's Society in 1862, and numerous cases were cited both of corrosion and its absence in iron under water, and the cause explained. The examples then stated, and numerous others, showed that cast iron of a particular descriptiou corroded rapidly, or changed its structure, by a few years' immersion in foul or salt water, while other irons were entirely unaffected when exposed in the same way for twenty, thirty, and forty years. The members stated that wherever this corrossion or decomposition had occurred, it was wholly due to the quality of the iron. The engineer has, therefore, only to select that of a proper quality to insure durability.

Cast iron, to resist corrosion to its greatest extent, should be as hard as the case will admit, of an even, close grain, and with the carbon combiued, and not in tbe form of graphite. Impure soft fonndry iron will corrode rapidly; close-grained grey iron, of an even texturo, will resist corrosion in the most exposed places without sensible injury, and white iron of good quality may, for all practicable purposes, he considered as imperishable in such situations. Care should also be taken not to place iron in contact witb other metals, so as to produce galvanic action.

It is well known that many cast iron water mains have corroded greatly, not only externally but internally. In the latter case tbe oxidation sometimes takes the tubercular form, where the rust is collected and aggregated in hard knobs.

The internal corrosion, however, where the iron is exposed only to the action of pure water and a small amount of air in combination, will not occur to any appreciable degree, if the iron is of the proper quality.

The strength of cast iron pipes, of the usual thickness, is so far beyond the pressure of the water aud occasional percussions, that the manufacturers seem to think that the weakest metal will answer; and the miners have not yet, in their specifications and inspections, required enough care in the selection of the metal best calculated to withstand corrosion.

Institute Fair Premiums.

The following is a list of the gold and silver medals that were awarded at the Mechanics' Institute Fair:

GOLD MEDALS.

First Class—To the Pacific Foundry, for best steam engine.
Second Class—To Coffin & Standish, for steam plow.
Eighth Class—To San Francisco Lead and Shot Works, for manufactured lead-pipe and shot.
Ninth Class—To C. Newman, of the San Francisco Glass Works, for best manufactured glassware.
Thirteenth Class—To Vanderslice & Co., for best California-manufactured silverware.
Fourteenth Class—To S. P. Taylor, for California-made paper.
Fifteenth Class—To George P. Kimball & Co., for California wagons.
Sixteenth Class—To Main & Winchester, for California-made saddlery and harness.
Eighteenth Class—To Wigmore & Palmer, for best California-made office furniture.
Twentieth Class—To Pacific Oil and Lead Works, for California-made oil and paints.
Twenty-second Class—To Jacob Zech, for California-made pianos.
Twenty-seventh Class—To B. N. Bugbey, of Folsom, for California wines made from foreign grapes.

The inventors' gold medal was awarded to Coffin & Standish, for the most valuable invention—a steam plow.

SILVER MEDALS.

To Union Foundry, for steam engine.
To Robert L. Harris, for Carvalho's steam superheater.
To Goff & Bishop for California-invented crank-pin and cross-head lathe.
To Baker & Hamilton, for sweepstake gang-plow.
To J. S. Detrick, for eccentric chuck.
To M. D. Laswell, for force-pump.
To H. W. Calvert, for dental goods.
To M. M. Cook & Son, for California-made artificial legs.
To Pacific Rolling Mill, for rolled iron.
To Pacific Saw Manufacturing Company, for California-made saws.
To W. T. Garratt, for California-made brass work.
To Golden State Pottery, for California-made pottery.
To Skinner & Flick, for California-made sanitary pipe.
To J. B. Boyd, for display of California laurel wood.
To G. Kustel, for collection of minerals.
To Oregon Iron Works, for Oregon pig iron.
To Haynes & Lawton, for California silver-plated ware.
To R. F. Rocchiccoli, for California silver-plated and gilded ware.
To H. H. Bancroft & Co., for California publications and ink.
To W. B. Cooke & Co., for California blank-books and ruling.
To A. Foreman, for improved type-machine—a California invention.
To A. Folsom, for buggies and wagons.
To George A. Brush, for samples of grained doors.
To Whittier, Fuller & Co., for California-made mirrors.
To P. Leisenfeld, for billiard tables.
To N. P. Cole & Co., for California-made furniture.
To Goodwin & Co., for California upholstery.
To Standard Soap Company, for soaps and candles
To F. E. Mills, for anthrophotoscope—a California invention.
To G. Rudolph, for California-made piano.
To Pacific Woolen Mills, for knit goods.
To Adolph Muller, for best display of manufactured furs.
To J. Neuman, for display of California silk.
To L. Prevost, for display of cocoons.
To Meyer, Jonasson & Co., for cloaks.
To Ladies' Co-operative Union, for display of needlework.
To J. R. Snyder, of Sonoma, for California redwood
To Isadore Landsberger, for California sparkling wines.
To B. D. Wilson & Co., for California port wines.
To Daniel L. Perkins, for vegetable seeds.
To California Sugar Refinery, for best refined sugar.
To Mrs. M. E. Gerrish, for wax flowers.

The inventors' silver medal was awarded to Charles Newman, for patent glass-melting pot.

The Institute Medal was awarded to the Pacific Tannery and Boot and Shoe Company, in view of the excellence of their work, the immense advantage which the people of California derive from their manufacture, and the benefit which is destined to accrue to tbe industrial interests of this State by the encouragement in its various forms of tbis branch of domestic enterprise.

Appropriate remarks were made by Mr. Hallidie and ex-Governor Low, in connection with the award of premiums and the termination of the Fair.

The list of diplomas that were conferred has not yet been completed, and will appear next week.

SMELTING IN INYO COUNTY.—We learn from Mr. Chas. A. Aaron, of Lone Pine (date of Angust 30th), that Desormeaux, at Cerro Gordo, bas started his large furnace, and got out seven tons of lead in five days, worth from $300 to $400 per ton. Tbe fire-clay proves excellent. Telshaw's furnace will be ready in a few weeks. Clark's furnace has failed for tbe present, but will he repaired. Water is sufficient for present demands. Owens Lake has risen since the earthquake on June 24th, and is still rising at the rate of about a foot a week.

AT THE STATE FAIR.—Mr. George Spaulding will represent the interests of the MINING AND SCIENTIFIC PRESS at Sacramento for a few days, at the State Fair, reporting, giving information to inventors, receiving subscriptions, etc.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

[From the Mechanics' Fair Daily Press, Sept. 12.]

Close of the Fair.

After to-night's proceedings the Fair of 1868 will belong to the past. It has been open for 31 days, not counting Suudays, and has beeu visited by from 200,000 to 300,000 people, if we couut in repeated visits hy the same individuals on different days as distinct visits. The receipts will exceed the expenditures by about $20,000.

Everybody is pleased with the way in which the Fair has heen conducted; and among those who have had occasion to make frequent visits to the Pavilion there is not to be overlooked, in the pleasant thoughts of tbe last day, the recapitulation in each one's mind of a host of intelligent and valuahle acquaintances.

The Managers, consisting of the officers aud directors of tbe Mechanics' Institute, have performed their especially laborious duties regularly and quietly, and without taking any especial pains to let the public know how much they have been laboring in their behalf, without the hope of reward. Such services, however, are always remembered by the commuuity, and are never thrown away. Without pulic spirited men there could be no San Francisco, and no California.

The relations between the Managers and exhibitors, it is scarcely necessary to add, have been very agreeable. For ourselves we can only say that we are gratified with the friendly manner in which the FAIR PRESS has been received and read by everybody, and with the liberal advertising patronage hy which it has heen sustained. Being identified specially with all that tends towards the development of the resources of the Pacific Coast, our interest and policy are to assist everybody to benefit and help berself, and we doubt not that our success will ever be proportionate to the degree of our usefulness.

The Blanks.

An inviting field for everyhody, hut especially for the capitalist and the student of political economy in California, is presented in the blanks in our industry, which are suggested iu connection with tbe Fair. Everyhody has observed how the former blanks,—of but a few years ago,—have been filled up, aud what astonishing results have been obtaiued in our midst in a short time; as well as the certain and ample reward of a little judgment in recognizing new wants of the community. The suggestions of the Fair are alone worth all that it has cost. We have not only been able to survey what has heen done, but to see more clearly what ougbt to be done.

Amongst these inevitable branches of industry which are not yet developed, we might mention flax and hemp culture, and their manufacture into linen and cordage; tbe tanning of tbe finer kinds of leather; iron smelting and forges to make wrought iron, steel, nails, etc.; lead and zinc production; the preservation of fruits and meats; tbe manufacture of clothing on a large scale, etc. There are certain wants recognized, and more that could be created, in China and Japan, which can only be supplied by Caucassian artisans for generations to come; and our tributary population embraces everything round the circuit of the Pacific Ocean, and eastward as far as the Rocky Mountains. Changes in wealth and occupation are rapid and frequent in our midst,—a state of things affording the most liberal encouragement to enterprise, the greatest facility for every one to find his proper place, and the highest rewards for intelligence and for executive talent.

FORD'S ROCK-BORING MACHINE has created some interest at Victoria, Australia, where it is said to have done work 75 per cent. faster, and one-half cheaper than can be done by hand labor. It is a common drill, operated by hot air.

THE PACIFIC WOOLEN MILLS.—This comparatively new manufacturing company made a very large and fine display at the Fair. They exhibited shirts and drawers of every size and variety,—all wool and merino,—also hose and half hose for men, women and children, consisting of all grades from the cheapest to the highest priced and best quality in the market. As these goods were gotten up with the greatest care and in the very best style, they will be found better than any similar articles of Eastern or foreign importation, affording the best satisfaction to the wearer. Those wishing to procure this class of goods, will find it economy to examine them before purchasing elsewhere.

MACHINE WORKS for the manufactnre of mill and mining machinery, steam engines, etc., have been opened by Messrs. Hawkins & Cantrell, at Nos. 210 and 212 Beale street, between Howard and Folsom. This firm are ready to guarantee all work turned out at their establishment, having had much experience in this line and being well acquainted with the different styles of machinery required by the community. See their card in our advertising columns.

CAUTION.—It would be well for those in the country who are afflicted with diseases and nervous difficulties, when they visit the city to find a doctor, to understand that there are more than one or two physicians who are successful in curing diseases if they do not belong to the Medical Institutes; and probably there would be a saving of time and money to try some one of the reformed practice before being burned, blistered and calomized; and that the *Electro-Magnetic* treatment, in some of the several forms, vapor baths, etc., is the safest, surest and best method, as applied by Dr. Benton, Congress Hall Buildiog, *Bush street*, San Francisco. *

DELICIOUSLY MEDICINAL.—This is the universal verdict pronounced upon PLANTATION BITTERS by all who have tried them. The well-known health-promoting ingredients from which they are made, and their invaluable merits as a remedy for indigestion and all its consequent ailments, and the preventive qualities against diseases arising from climatic changes, mismatic influences and imperfect secretions, are so widely known and so honorably endorsed, that we trust no one will forego the advantages of their use. *

WANTED—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instant-
ly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 652 Market street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

NORTH AMERICA
Life Insurance Company.

Usual Restrictions on Occupation and Travel

Support Home Manufactures.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
HOSE AND TAPE FUSE,
A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.
JOS. POWNING, Sec'y. JAS. EVA, Supt.
17v16 9ptf

PACIFIC
Rolling Mill and Forge Co.,
SAN FRANCISCO, CAL.

Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Pistons and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.

☞The highest price paid for Scrap Iron. 9v143m9p

REBELLIOUS ORES.

Parties interested in the treatment of
REBELLIOUS GOLD OR SILVER
ORES
—ARE INFORMED THAT THE—
Hagan Furnace Process
Is now in successful operation at the
ENTERPRISE MINE,
NEAR CISCO,
And they are respectfully invited to examine the working of the same.

For particulars, inquire of W. A. WILLIAMS, Superintendent, at the mine, or address
PACIFIC ORE COMPANY,
P. O. Box 1019, San Francisco.
September 11, 1868. 11v17-2w

A Book for Every Miner and Scientific Man.
JUST PUBLISHED,
KUSTEL'S NEW WORK,
CONCENTRATION
Of all kinds of Ores, and the
CHLORINATION PROCESS,
For Gold-Bearing Sulphurets, Arsenimets, and Gold and Silver Ores generally.

Price, - - - - - $7.50

A liberal discount to the Trade. For sale by the Booksellers Sent to any part of the United States, postage paid, on receipt of the price. Address,
DEWEY & CO., Publishers,
Office of the Mining and Scientific Press, 414 Clay street,
16v1tf SAN FRANCISCO.

Wanted.
A situation as an Amalgamator and Assayer, to take charge of a Quartz Mill. Best Reference given. Address "Assayer," at this office. 12v17-1t

New Potato Digger.
Parties interested in saving considerable time and money by using the
PACIFIC
POTATO DIGGER AND SACKER,
Should not delay the present opportunity of having one in time for the late Potato crop this season.
☞Liberal terms to Farmers' clubs ordering more than one. This arrangement secures to members in rotation the great benefit of a machine, and materially reduces their outlay. A Potato Digger of this kind is sufficiently strong for general ranch purposes, and will dig, clean and separate, according to sizes, and sack six to seven acres of potatoes daily, besides the important saving of so much time, and at less than half the cost of the present expensive and dilatory method by hand.
It would require one man from forty to fifty days to accomplish the same amount of work.
A WORKING MODEL may be seen from 11 to 12 and from 1 till 6 o'clock daily, in operation until the 10th of October, at Risdon's Machine Works, corner of Beale and Howard streets, San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

VALUABLE

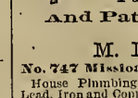
N. E. corner of Tehama and Fremont streets, above Howard street, San Francisco. 3-qy

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,

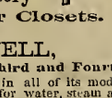
Howard st, between Fremont and Beale, San Francisco.

Fine or Tubular **Boilers**, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.



Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.



To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1vt6tf

HYDROSTATIC
WORKS.

SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting brass Pumps, similar to the Hadden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country. I have now on exhibition at the State Fair thirteen Pumps in brass and iron, all of my own make, which can be seen at my place after the close of the Fair.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom. Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair.

☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 1tv17-tf

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

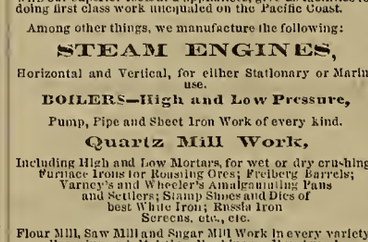
BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Burnsbow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.



Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Patent Elastic Soles.

We noticed on exhibition at the Fair, Daggett's Elastic Ventilating Inner Soles, on which there are some six or eight U. S. Pateuts, owned by Edwin A. Hill, of No. 7 Union street, Boston. We subjoin the proprietors' claims and remarks concerning this interesting invention, as follows:

The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. There is no contact of the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps, working at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking on hard substances, also to all persons whose business requires much walking or standing.

These soles are affording great relief to persons afflicted with rheumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

The feet are subjected to the greatest extremes of heat and cold, and deprived of that most essential element of life and health, air.

No part of the body is treated with so little judgment, while no part requires the exercise of more. The fluids of the body naturally gravitate towards the feet, and the outlets or pores are larger and more active. They pour out more waste matter than any other equal surface. If the evaporation is checked, their covering becomes saturated with the perspiration, and the feet softened, chilled, tender and unhealthy, and the whole system diseased as the result.

Nature repairs damages more slowly upon the feet than upon parts nearer the heart, therefore, greater care should be taken to protect them from injury.

The patent right for the sale of the soles for the Pacific Coast can be secured by addressing the patentee, or A. H. Hale, box 17, San Francisco.

ANOTHER SUBMARINE TUNNEL.—It is now proposed to make a tunnel to connect Scotland with Ireland. The points where the tunnel is to have its mouths are Leak's Point, in the Mull of Cantyre, and the coast of Antrim respectively. The length would be about fourteen and a half miles, and the cost is estimated at only £3,150,000.

MINES AND MINING MACHINERY.—One of the occurrences most to be regretted in connection with the recent Fair, is the meager display of minerals and mining machinery—articles which should have stood in the leading rank. Another year we have reason to expect a better display. Thomas Varney's amalgamating pan, which is so extensively in use throughout this State and Nevada, is the only representative in the Exhibition of a formidable list of competitors, which used to form an important feature in our Fairs. Hinkle & Capp's, and Hepburn's new amalgamating pans are exhibited for the first time; also Hendy's and Hungerford's concentrators of improved style. Rix & Varney's quartz crusher, a formidable machine, has stood like a monarch alone, and like the rest have not been tested in competition. Capt. Cox's pulverizer, we regret to say, has not run during the Fair. Let us suggest that special rewards be offered at our next Exhibition for the best machinery and best processes for reducing ores.

SEWAGE UTILIZATION IN INDIA.—It is reported that the Local Government, Central Provinces, has called upon its officers to take steps to utilize the sewage of towns and of military cantonments for agricultural purposes, and it has also furnished them with a very valuable memorandum by Mr. Bulk, Secretary to the Cawnpore Municipal Committee, explaining the cost of cultivation and returns of land manured with latrine poudrette in the vicinity of Cawnpore during the years 1866-67. The Cawnpore Committee have realized a clear profit of 313 rupees per acre in a year by manuring the land, which they cultivated with sugar-cane, with the latrine sewage. A greater truism was never propounded than that dirt was matter out of place. The day is, of course, very distant when sewage of towns in India shall become an article of commerce.

NORTHWESTERN WOOL GROWERS.—The first exposition of the woolen goods manufacturers of the Northwest, opened a few weeks ago at the rooms of the association, in the city of Chicago. Samples of goods were on exhibition from all the Western and several Eastern States, numbering about fifteen hundred lots, representing eighty mills.

NEEDLES.—Needles were first made in London by a negro from Spain, in the reign of Queen Mary. He died without imparting the secret of his art. The art was recovered in 1565.

A UNITED STATES Exploring party, under Lieut. J. E. Griffith, have reached Montreal River in their surveying and mapping operations of Lake Superior.

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

SAN FRANCISCO
HYGEIAN HOME WATER CURE.
No. 637 California street, opposite St. Mary's Cathedral.
WE HAVE NOW THE MOST EXTENSIVE AND COMplete Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest persuance of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a Home combining all the Hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the prices for gentlemen to $50 per month; to ladies from $15 to $20 per week for board and treatment.
HARLOW J. SMITH, M. D., Physician and Surgeon.
H. G. COSGROVE, Superintendent. 21v16-3m

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent. less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

Mining Secretary.
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

Room 37 New Merchants' Exchange, California street, San Francisco. 17v15-tf

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

[From the Mechanics' Fair Daily Press.]

What the Mechanics' Institute Does and Offers.

Not a word needs to be said to convince San Francisco or its visitors during the Fair season, of the good that is done practically and substantially by such an institution as the Mechanics' Institute. But we will remind the visitor that this is not the only public benefit which has been called into existence by that most useful association. This is merely a temporary, though an extensive and powerful agency of industrial development; whilst there is also a permanent institution having many attractive features and operating constantly toward the same end, sustained by them on Post street, which no one who has visited the Fair should fail some time or other to visit. It is a splendid new building, containing a first-class library and reading-room, which are available to all at moderate prices. In the lecture-room there are to be held, hereafter, stated meetings for the discussion of questions of general interest in the development of the coast. Probably a cabinet of models of machinery and mineralogical specimens will soon grow up in connection with these efforts toward practical usefulness, from donations, or for temporary exhibition. All who are in any manner interested in what is going on in our midst would act wisely and do themselves a favor by identifying themselves with this, or any other equally efficient organization for the advancement of the coast. Members are of three kinds: Life members, who pay $50; stock members, who pay $5, on initiation (as an installment on a share of $25), and $1.50 quarterly dues; and subscribing or reading members, who pay $1.50 on initiation and $1.50 quarterly. Of the first kind there are about 50, of the second 900, and of the third 350, belonging to the Institute.

CONSTRUCTION.—The contract for building the railroad bridge across Yuba river at Marysville, has been let to Hudson & Binney, and connections will probably be made by the end of November.

NOTICE.

On and after this date, all parties on the Pacific coast manufacturing, using, or selling

Dunbar's Patent Piston Packing,

must obtain a License for the same from the undersigned, or they will be subject to the penalties of the law.

H. S. SMITH,
Ætna Iron Works.
San Francisco, August 15th, 1868. 7v17-3m

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada as about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.

Pacific Mail Steamship Co's

STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. M. S. S. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR SEPTEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

September 5th—GOLDEN CITY Captain E. S Farnsworth, Connecting with ALASKA, Capt. Gray.
September 14th—SACRAMENTO.....Capt. W. H. Parker, Connecting with OCEAN QUEEN, Capt. King.
September 22d—MONTANA.....Capt. J. M. Cavarly, Connecting with HENRY CHAUNCEY, Capt. Conner.
September 30th—CONSTITUTION..Captain W. H. Hudson, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each admit.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship JAPAN, Capt. Geo. E. Lane, will be dispatched on MONDAY, August 3d, at 12 o'clock, noon, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

[From the Mechanics' Fair Daily Press.]

Special Mention.

Nelson & Doble's drilling machine is a hand drill, with compound cog-wheels forming the connection between the drill and the propelling handle.

The steam plow of J. Marquis is worthy of examination. It is similar to the Staadish plow, in having revolving blades at the stern end of a locomotive, but the revolutions are vertical instead of horizontal. The blades are on the principle of propeller blades, and are intended not merely to pulverize the soil, but also to turn it. The traction of ordinary plowing is rendered unnecessary; and if the propellers will work in practice, or turn the soil in any moderately satisfactory manner, the invention may become valuable. It is well worthy, at any rate, of a fair trial on a working scale.

A. Wingard's model of a patent steamboat wheel is a wheel with a series of three-bladed paddles, intended to save power in the method of striking and leaving the water.

T. B. Roche's patent swivel shackle has a swivel in the clevis bolt, permitting ropes and chains to twist and untwist with the swivel.

The Giant Powder Company have added samples of their product, which resembles sawdust in appearance. It contains the explosive substance of nitro-glycerine, and is sold by the proprietors of the same, as an improvement. It is being introduced in some of our mining districts.

S. C. Bradshaw exhibits Payson's Gymnastic Swing, which is so constructed that the occupant can very agreeably use his arms to put himself in motion.

Epes & Ellery exhibit a patent india-rubber paint, consisting of dissolved rubber mixed with some coloring matter, the advantage of which is obvious where a tough or water-proof coating is required. A canvass bag painted with it and filled with water a year ago, still contains the water, and is evidently less impervious than wood.

Special mention is also deserved by several beautiful working models of steam engines, which will be better appreciated when seen than when described, viz.: the engines exhibited by S. C. Higgins, Robert Blair, C. H. Foster and J. M. Greiss. H. A. Martin's California invented double cylinder, 4-horse power oscillating engine, is a plain but serviceable machine, the operation of which reminds one of the motions of the arm in turning a crank.

Atwood & Bodwell's self-lubricating journal is a very simple device to circulate the oil in the box.

New Patent Plow.—A mechanic named Cone has just completed in this city a new plow or cultivator, which, in the opinion of some who have examined it, will exceed in efficiency and utility any plow heretofore invented. The main feature of the invention is a series of eight pulleys, supplied with knives or spades attached like spokes to a wheel. The pulleys are all placed on the same shaft, and as the machine moves forward the spades dig up a belt of ground about six feet in width. They raise the earth and pulverize it, throwing it backward. One machine has been made and taken to Sacramento for exhibition during the State Fair. It is drawn by six horses or mules, with which power it will plow ordinary soil about as fast as a span of horses will harrow it. A satisfactory experiment has been tried with the machine in Napa County. Mr. Cone has applied for a patent for the above through the Mining and Scientific Press Patent Agency.—*Morning Chronicle.*

A few files of the Daily Fair Press, bound in board and leather, can be had at the office of the Mining and Scientific Press, for $2.50. Apply soon, at 414 Clay street, below Sansome.

Catalogue.—Copies of the Mining and Scientific Press, containing a revised edition of the catalogue of the Fair, may be had at the office, 414 Clay street.

The Pacific Straw Works, No. 335 Bush street, have their goods tastefully arranged in a revolving case near the left hand entrance to the Art Gallery, in the rear of the Pavilion. The articles consist principally of straw goods in every variety, felt hats; lace, buckram and illusion frames. They also exhibit an ingenious machine of their own manufacture, for making buckram frames,—the whole making a very pleasing and creditable display. The company commenced operations here about six years ago, since which time they have gradually extended their business, until it has now become an important, if not an indispensable part of our industry.

New Mining Advertisements.

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of September, 1863, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1863, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of November, 1863, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. sep19 2

Providence Gold and Silver Mining Company, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1863, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of October, 1863, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifth day of November, 1863, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. sep19

Mining Notices--Continued.

Bunker Hill Quartz Mining Company. Location of Works: Near Amador, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of May, 1863, an assessment (No. 8) of ten dollars ($10) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to Daniel Palmer, No. 134 State street, Boston, Massachusetts.

And whereas said assessment was not duly advertised as required by law, and as contemplated by the resolution making the levy, at a subsequent meeting of the Board of Trustees, held September 2d, 1863, it was resolved, that—

Any stock upon which said assessment shall remain unpaid on the sixth day of October, 1863, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1863, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of August, 1863, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of September, 1863, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventh day of October, 1863, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. au29

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of August, 1863, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Alberding, F H	44, 45, 46, 47	79	$158 00
Bliss, D L	12	200	400 00
Blauvelt, W H	22	60	120 00
Grim, A K	23	206	412 00
Gray, T C	50	20	40 00
Gillig, Mott & Co	not issued	100	200 00
Gillig, Mott & Co	14	75	150 00

T. B. WINOARO, Secretary.
Office, 408 California street, San Francisco. sep5

Postponement.—The above sale is hereby postponed until Wednesday, the twenty-first day of October, 1863, at the same hour and place. By order of the Board of Trustees.

sep19 T. B. WINGARO, Secretary.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

Machinery.

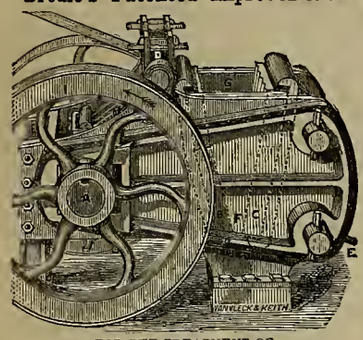
VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 9 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

SWYNEY & SMITH,
MARINE ENGINEERS,

53 Montgomery Block, San Francisco,

Are prepared to furnish General Plans, Specifications, and full detail Drawings for propeller or side-wheel steamers, also for iron vessels of all classes, engines, boilers, etc. Also for locomotive or stationary engines, and machinery in general. An experience of over twenty years in this profession enables us to furnish correct drawings and guarantee results.

JOHN SWYNEY. 8v17-tf DAVID R. SMITH.

The Soda and Salt District of Mexico.

The following is interesting to the interior Pacific States, as descriptive of what will soon become a branch of industry in our own midst. The discovery of nitrate of soda in conveniently attainable quantities would be a valuable addition to our resources, as it furnishes the principal ingredient for the manufacture of powder:

This singular region contains 720 square miles of territory, the soda, or "tequisquite," as it is generally called in that country, being chiefly deposited on the lowlands by the lake of Texcoco, about six miles from the city of Mexico, and which sometimes overflows up to its gates. It appears that the mud of this lake contains four per cent. of soda, and the water itself gives the following results on analysis at 1° Beaumé, with a density of 1.0069: Water 90.890, chloride of soda 0.570, carbonate of soda 0.485, and sulphate of soda 0.054. The efflorescent soda deposited upon the lands referred to is to be found in much more considerable quantities during the winter or dry season in Mexico than during the summer, when the diurnal rains wash much of it away, nor can it be collected during the latter season as the water soaks into the soil; but upon the return of dry weather, the rays of the sun evaporating the moisture upon the surface, that left below gradually rises; and by this natural process the salts are consolidated, forming a crust, according to Señor Almarez, in his *Memoria para servir la Carta Hydrografica del Valle de Mexico*, generally about one centimeter thick. Sometimes, also, the efflorescence may be produced by plowing up and afterwards watering the soil. The efflorescence begins to be observable at the end of autumn, its white and crumbling flakes concentrating themselves by the action of the winter frosts into the crust above referred to and which is composed of two descriptions of "tequisite," or soda, called by the natives of the districts around "cascarillo" and "polvillo," and which are scraped up and deposited in cellars, either for immediate sale or for purification on the spot. The soda which is obtained from the waters of the lake themselves is generally not perceivable until a considerable evaporation of them has taken place, when it appears upon the surface of them in the form of a frothy substance denominated "espumillo" by the natives around, and for the obtaining of which the waters of the lake are dammed up into pools, so soon as they begin to retire, by heaping up mounds of earth around them.

Hay, an English gentleman, having some works on the spot, calculates that he gets 15,000 quintals of crystallized soda at his works, which sells in the city at $10 per quintal, and Mr. Bowring asserts, in a paper recently published in France, that 60,000,000 tons of soda may be obtained from the bottom of the lake. Mr. Seager says that the cubic metre, at ten per cent. in solution, contains 216 pounds of common salt and soda in equal proportions. The waters of an upper lake called Xachimilco, which are carried into the former lake, are reckoned to carry forty-seven metrical tons of soda into the Texcoco.

The simple mode of proceeding hitherto pursued by the natives of the country for the separation of the soda and the common salt from the other substances, and which is still pursued in the more remote silitrous lands of the country, has been replaced in other places by other means for attaining the same end, suggested by chemical science and modern discoveries. The old system consists in diluting and filtering the silitrous earth referred to, and which is placed in large pans formed of the earth, from which the "tequisquite" has been already extracted, and in which branches of trees are placed crossways and entwined with rushes or "petate," a kind of grass used for matting, so as to stop the earthy particles and sulphate of soda from passing through, the pan being pierced at the bottom so as to admit of the passing through of the water, which, being conducted by means of a hollow reed or of a maguey leaf, into tanks, evaporation is effected by the action of the air and the sun, or by means of artificial heat when the water is conducted into boilers. The salineros who conduct the salt-works convey the water to the hight of twelve inches into troughs of masonry, which are of two descriptions, called respectively "concentradoras" or "concentrators," and "cuajadoras" or "coagulators;" and the water runs gradually from those of the former into those of the latter denomination, in which the time consumed in the process of crystallization naturally depends upon the temperature of the atmosphere or other meteorological causes; but it is cal-

culated, that the solution being at 18° to 20° Beaumé, and the water being from two and a half to three inches in depth, crystallization takes place in four days in summer and in eight in winter. The earthy particles contained in the water are cleared out of the trough so soon as they appear; the chloride of sodium then crystallizes and forms a crust of about a miriametra thick, and adheres to the bottom of the trough; the saline particles then forming themselves into small heaps as the water dries up, being finally spread out to dry and harden in the sun. Salt and chloride of sodium being alone required in the districts of San Luis Potosi and Zacatecas, referred to on account of their being extensively used in the reduction works of the silver mines in the vicinity, the sulphate of soda, which is likewise obtained by the operation in question, is taken into no account whatever, but is left piled up in immense hillocks and as a mere refuse around the various salt works.

With such vast resources in the elements of purification, it is to be presumed that the Mexicans are very clean in their ways. Possibly the Ethiopian might have his skin changed were he dipped in this strange lake, which seems like a great washing tub for the whole world.

THE DAVY LAMP SUPERSEDED.—Since the invention of the Davy lamp—which, although a wonderful discovery, gives but a faint light, is not perfectly secure against the dangers of explosion by fire-damp—the English Government has offered the sum of £4,000 as a reward for the invention of a lamp burning without contact with the external air. Two young students of the Polytechnic, MM. H. Liauté and L. Denoyel, have carried off the prize. An oxygen lamp had been already constructed, but it could only burn under water by means of a supply of air pumped into it by machinery which required four men to work. The newly invented lamp burns alone, carrying within it the requisite supply of gas. The savants denied that this could be done. A man in the costume of a diver descended into the sluice opposite the Mint to the depth of eight feet; the lamp burned beneath the water, and at the distance of two yards from him the diver was able to inscribe with a diamond, on a piece of glass, the date and hour of the experiment. The lamp burned for three-quarters of an hour in the water, and when it was hauled to the surface it was still burning, and the flame as bright as ever. It has been made by M. Delenil, constructor to the Polytechnic. Several members of the Institute, pupils of the Polytechnic, as well as several journalists, were present at the experiment, and cheered frantically when the lamp was drawn out of the water burning brightly, at the expiration of three-quarters of an hour. Not only will this invention prevent the danger of explosions in mines from fire-damp, but it will enable search for drowning persons, or for property lost by shipwreck, to be pursued with the utmost facility.—*Paris Cor. Star.*

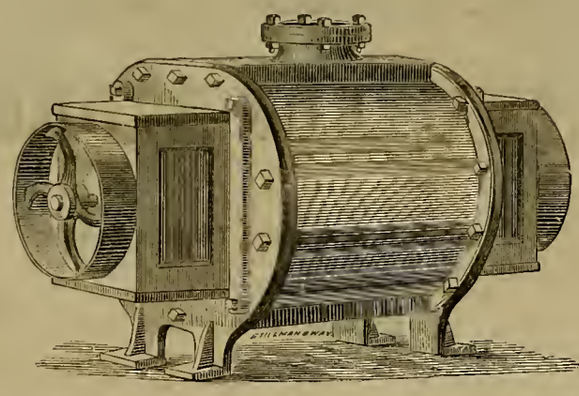
OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

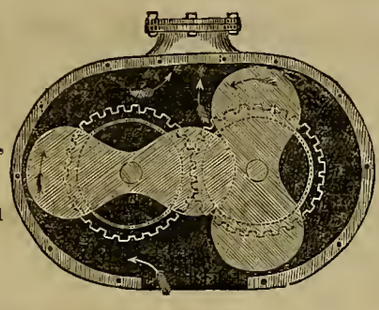
Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of $100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by



M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non illuminating flame and light on a wick as easy as a lamp. 21v16 3m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

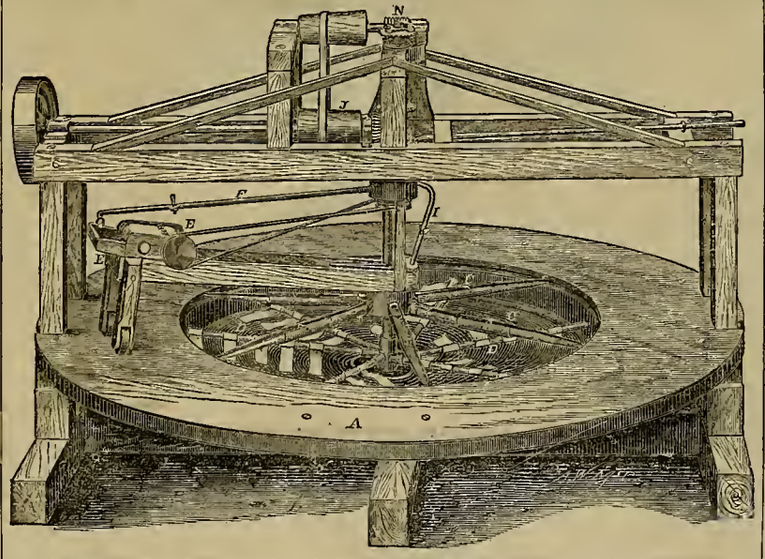
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.



For circulars and further information, address

KEEP, BLAKE & CO.,
4v16 3m **Globe Iron Works, Stockton, Cal.**

PAINE & STEPHENS'

IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16 6m

$100 A MONTH SALARY WILL BE PAID FOR Agents, male or female, in a new, pleasant, permanent business. Full particulars FREE by return mail, of sample, retailing at $4 50, for 50 cents. A. D. BOWMAN & CO., No. 4 Broad street, New York.
(Cut out and return this notice. 6v17-7t

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

HANSCOM & CO.

HANSCOM'S ROCK CRUSHER.

The best of the kind in use. Right secured by U. S. Letters Patent.

VARNEY'S IMPROVED QUARTZ GRINDER,

Which only needs examination to be appreciated.

TYLER'S IMPROVED WATER WHEEL

Gives greater power at lower cost than any Wheel in use. All Wheels warranted to give the power as set forth, or the money will be refunded. Send for one of our circulars, giving full tables.

G. T. BOHEN'S PATENT CESSPOOL COVERS.

Sole manufacturers of the above Patent. Castings always on hand.

HAYES' IMPROVED STEAM PUMP.

For pumping out mines or pumping water in any way, this is considered by miners and engineers as superior to anything now in use. Parties on this coast now using them will attest to their efficiency.

HOUSE FRONT CASTINGS.

We claim to make the best castings of the above kind of work now made on the Pacific coast, and think that a reference to our work will bear us out in the assertion. We would call the attention of the public to the following Iron Fronts made by us for good work, to wit: Fireman's Fund Insurance Building; San Francisco Savings Union; the New California Market; Chas. Land's Building, on the corner of Sansome and Bush streets; Dooly Block Co's Building, on the corner of Sutter and Sansome streets; Kennedy's Warehouse, corner Broadway and Battery streets; Livingston's Building, corner California and Battery streets; the new Calvary Church Building, corner Geary and Powell streets; new Theatre, on Bush street, and many others that we have not space to mention.

VARNEY'S NEW PAN.

Mr. Varney, by long practical experience and close study of the working of Pans, has succeeded in bringing his Pan to great simplicity and perfection. All parties interested should make it a point to examine the new improvements, as it will well repay for the time so spent.

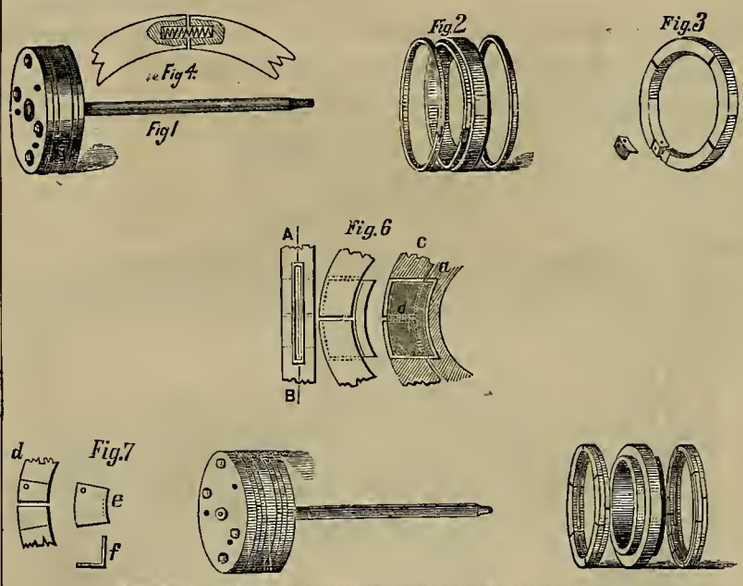
J. O. HANSCOM, H. S. SMITH. | THOS. PENDERGAST. W. W. HANSCOM.

HANSCOM & CO.,

ÆTNA IRON WORKS,

S. E. corner Fremont and Tehama Streets,

SAN FRANCISCO.



PRACTICAL MACHINISTS AND IRON FOUNDERS.

— MANUFACTURE —

Steam Engines, Quartz Mill Machinery,

SAW MILLS, FLOUR MILLS,

And all other kinds of Machinery that may be desired.

DUNBAR'S SELF-ADJUSTING STEAM PISTON PACKING.

The accompanying and following are some of the specialties of the work of this Establishment:

DUNBAR'S PATENT PISTON PACKING,

WITH SMITH'S IMPROVEMENT,

There are of this Patent upwards of THREE HUNDRED in actual operation on this coast. It requires no springs or screws, is always steam tight, without excessive friction, and never gets slack or leaky. Any amount of recommendations can be given on application.

HANSCOM & CO.

JOHNSON & BURCH'S PATENT EUREKA CLUTCH AND BRAKE.

The Clutch is extremely simple, and can scarcely, by any possibility, get out of order, and will never wear out, except by decay or decomposition of the material of which it may be made. It is designed for hoisting purposes generally, and is just the thing for miners. We should not then hear of the mining accidents which occur daily from the giving away of hoisting gears. Parties using them in stores in this city give some of the best kind of certificates of their value over any other kind of Friction Hoist.

W. W. HANSCOM'S IMPROVED DIRECT-ACTING STEAM PUMP.

Being made of only five pieces of metal, and having only two movable parts, it is considered by experts to be the simplest and best feed Pump ever yet invented.

CARVALHO'S PATENT STEAM SUPERHEATER

A very valuable invention for economy of steam, suitable for all purposes of heating and drying steam. Recommendations from parties using them in this State can be had on application.

BEMIS' PATENT GRATE BAR,

For burning screenings and fine coal, soft or hard. This is a very valuable invention, and has done more for the benefit of California coal mines than anything else. By the use of this Grate Bar, all the debris and screenings can be used which formerly had to be thrown away. It is in use in about all the steamers on this coast and for many land boilers. All parties using coal will find it to their advantage to use these Bars.

ORNAMENTAL CASTINGS.

We have established a special department for Ornamental Work, Stove Plate, Piano Plates, and all kinds of Fancy Castings, to which public attention is respectfully called.

All of the above mentioned articles will be on exhibition at the Mechanics' Sixth Industrial Fair, and the attention of the public is respectfully called to the merits of each article as set forth.

MINING AND SCIENTIFIC PRESS.

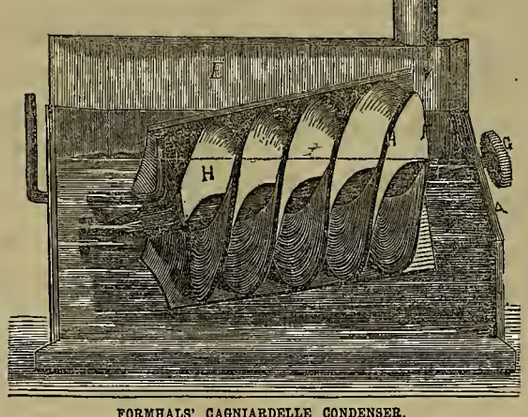
Subscription, $5 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, SEPTEMBER 26, 1868. VOLUME XVII. Number 13.

Table of Contents.

Formhals's Cagniardelle Condenser—Illustrated.
The Mechanics' Institute Fair Awards.
Mining in El Dorado County.
The Ragan Furnace.
Mexico.
Treatment of Ores Suitable for Chlorination.
Brigham Young on Mining.
California and Nevada Drying Up.
North of China Gold Mines.
Californians in the China Gold Mines.
Scientific Reconnoissance in Russian America.
Academy of Sciences.
Acenegue Hydrogen in Roasting—The Ragan Furnace.
Fifteenth Annual State Fair.
Capital and Labor.
San Francisco Mining Shareholders' Directory.
New Patents and Inventions.
MECHANICAL MISCELLANY—A New Dynamometer, or Force Measurer, from Oregon; Steel Rollers; Steam Engines; Bridging the Mississippi; Iron Smelting Operations in Mexico.
SCIENTIFIC MISCELLANY—Familiarity With and Uses of Electro Magnetism; Artificial Mineralogy; The Japanese Earthquake Alarm Not Reliable; Carbonization of Wood; Manufacture of Sulphuric Acid.
MINING SUMMARY—Comprising late Intelligence from the various counties and districts in California, Arizona, Ala-ka, Colorado, Idaho, Montana, Nevada and Oregon.
San Francisco Market Rates. Stock Prices—Bid and Asked. Notices to Correspondents.



TOWNSHIP AND COUNTY MAP OF CENTRAL CALIFORNIA.—We have before us Mr. Doolittle's map of the counties of Butte, Yuba, Nevada, Placer, El Dorado, Sacramento, and parts of Amador and Sutter; showing the township lines, the Pacific Railroad, the Placerville, Marysville and Oroville roads, the gravel claims wherever worked or discovered, and an immense number of other details which have never been represented on any map heretofore. It is the want of such definite information as may be found in this map, that has many a time deterred capitalists from taking the trouble to inquire more definitely into representations concerning valuable mining properties, or promising agricultural and business localities, viewed with regard to the permanent development of the country. Not capitalists merely, but all of the more stable and far-sighted of our citizens, are by this time getting into a position to profit by the general course of the future of the interior counties. There can scarcely be any doubt that thousands of manufacturing enterprises will yet be seen in busy operation in the delightful foothills of the Sierra Nevada, by the same eyes that roved in search of gold in 1849-50. What country in the world is more favorably situated for manufacturing? and is it not beginning to be demonstrated by profitable returns that we shall have control of the markets of the occidental world? That the foothills are only in a transition state is evident; but it seems strange that we have had no better maps of the interior counties up to the present time. Mr. Doolittle is intimately acquainted with the entire country which he has here represented. He has noted the U. S. Land Surveys, and land districts, the school-houses, post-offices, roads, ranches and farms, ditches, bridges, ferries, dams, tunnels, quartz veins, mills, ancient river channels, bedrock ranges, etc., and has been engaged in collecting his data for six years. On the margin are plans of Nevada City, Grass Valley, Oroville, Marysville, Lincoln, Folsom, San Francisco, Sacramento, Washington, in Yolo County, Nicolaus, Auburn, and Placerville, besides diagrams exhibiting the latitudes and longitudes from Monte Diablo, the Pacific Railroad to Winnemucca Station in Nevada, and an abstract of the Pacific Railroad Land Law; scale two miles to the inch; territory represented, 4,000 square miles. Brown & Harnett are the lithographers. The map is to be sold by subscription at $5.75.

AN auction sale of six hundred acres of farming land adjoining the city of Vallejo, will take place at Maurice Dore & Co's salesroom, on Montgomery street, on Wednesday, September 30th, at 10½ o'clock A.M.

Formhals' Cagniardelle Condenser.

Amongst the numerous devices to which quicksilver miners have been forced to have recourse for protection from the evil effects of mercurial vapor, the cagniardelle blower has been applied by Mr. Formhals in such a manner as to draw the noxious fumes out of the furnace as soon as they are formed, and to condense them while passing them through tanks containing water. The cagniardelle was invented in 1809, by Cagniard Latour, but was not brought into general use till 1834, when the inventor delivered a lecture before the Academy of Sciences which gave it new life; it was then extensively tried throughout Europe, but again fell into disrepute on account of the difficulties in its construction, the great first cost, and its liability to leak; and now there are but few in use, although they are the simplest, and when once constructed, the most powerful and economical blast engines ever invented,—for which purpose they have been heretofore used in metallurgical establishments. Their application to the condensation of noxious vapors, however, is entirely new, and it is an idea of sufficient merit to warrant the application for a patent, which has been granted through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Quicksilver, especially, can be condensed very conveniently in this manner, as the cagniardelle necessarily runs in water, and the mere passage of the fumes through the machine suffices to condense the greater portion before they are driven through a conducting pipe into the second tank. But the great merit of Mr. Formbals' invention does not lie so much in the application of the cagniardelle as a condenser, as in his manner of construction, by which he has finally succeeded in rendering it fully as durable and at a price not exceeding one-fourth the cost of the former ones. This is done by winding thin strips of wood around the shaft, a guide being used to form the spiral and a roller to press the strips firmly together, till the screw has acquired a sufficient size, when the outer cylinder or cover is driven on, and hot asphaltum allowed to run through till the interior is thoroughly coated, and thus rendering it impervious to and indestructible by the acid vapors which may pass through it.

The operation of the cagniardelle will be understood by reference to the engraving. The screw-shaped flanges, H, are seen on the inside of a cylinder of sheet iron, which revolves in a tank filled with water, up to the dotted line. As the end of the flange, F, dips into the water, the communication of the air inclosed in the winding inside of the cylinder is cut off from the air above; and as the cylinder continues to revolve, the air is forced along, like the operation of screwing it forward, being, of course, always above the water line, until it has reached

FORMHALS' CAGNIARDELLE CONDENSER.

the end of the winding, when it is forced with great velocity through the pipe which is seen to emerge from the tank at the left hand side. At the top is a pipe which connects with the furnace, from whence the vapors and gases are drawn.

It cannot get out of order, and the power requisite is very small, when compared with the ordinary cylinder and piston machines. Another objection to it formerly was its bulkiness for transportation, which could only be urged with any force in regard to its application to works located in distant and mountainous districts. This difficulty is now overcome, as it can be constructed wherever it is needed.

The following letter from the best metallurgical authority in the world, will sufficiently explain itself:

BERLIN, Feb. 19th, 1868.

MR. F. FORMHALS, San Francisco:—With the greatest interest have I read your communication in regard to your apparatus for the condensation of metallic vapor, which you had the kindness to send to me in your letter of December 30th last. The same is capable of doing that which was hitherto hardly possible to accomplish with the existing facilities, namely: a very perfect condensation of the vapors in a comparatively small space, and at moderate cost of construction.

For the efficiency and durability of the cagniardelle, I refer you to the experience with the same which has been had at the Mansfield copper smelting works, where they are preferred to the cylinder blast machines. That the intimate contact of the metallic vapor with water, which your apparatus is capable of securing, produces a very perfect condensation, has been shown in Bennett's Condenser. The objection that the cagniardelle will be destroyed by the acid waters, as for instance, in the treatment of mercurial ores, must be overcome by coating it with varnish.

Should you be disposed to allow me to use your communication on your apparatus after further trial, and to publish the same in the *Berg u Huttenmanesche Zeitung*, I would be much obliged to you.

Yours, respectfully,

BRUNO KERL,

Professor of Metallugy at Berlin.

Mr. Formhals has already secured protection for his invention in several foreign countries, through the MINING AND SCIENTIFIC PRESS Agency.

THE FORWARD MARCH IN CHINA.—A clause in our treaty with China reserves to that country the right of determining when and where telegraphs and railroads are to be constructed; in short, to open or close the door against the introduction of that machinery whereby the world moves in modern times. But we have evidence that the Chinese Government does not intend to be illiberal in its construction of that treaty with America at least, in the fact that it has conceded to the East India Telegraph Company, organized under a charter from the State of New York, the privilege of connecting the great seaports of the Empire with a submarine cable, and that the company proposes at once to lay 900 miles between the following ports: Canton, Macao, Hongkong, Swatow, Amoy, Foo-Chow, Wan-Chu, Ningpo, Hang-Chean and Shanghai. The foreign trade of these ports is said to amount to $900,000,000 annually.

NICHOLSON PAVEMENT LAWSUIT.—In the action of the Nicholson Pavement Company *vs.* Hatch and others, owners of the Stow pavement, in the U. S. District Court, Judge Field has rendered his decision in favor of the defendants. The suit was in the nature of a trial for infringement of the Nicholson patent, and the Stow Company relied on proof of having applied a new principle in the manner of wedging the wooden blocks together, without the use of a board foundation. The Stow pavement presents the same external appearance and has the same qualities as the other, but has no resemblance in its foundation. The Nicholson party claim exclusion of moisture from below as one of the principal benefits of their pavement. The Stow party acknowledges that moisture penetrates their blocks from above and below, but there being no foundation to intercept its absorption, it readily escapes. The Court does not decide upon the merits of the pavement, but on the issue presented that the combination for which Nicholson obtained his patent has not been used in all its parts. It is understood that the case will be appealed.

WINGED ANTS were passing over Shasta valley on September 9th in great swarms, flying from west to east at an elevation so as to strike a person seated on a load of hay. Mr. H. Wells walked ten miles before passing the breadth of the swarm.

Mechanics Institute Fair---Awards.

The following list of awards made to exhibitors at the late Mechanics' Fair has been carefully compiled by direction of the Board of Managers. We are informed that it would have been made public sooner, but for the delay of some of the Committees of Judges in handing in the lists of the awards made in the various departments or classes. It will be seen that the list is still incomplete, but the exceptions will be published within a few days. Medals, diplomas and certificates will be delivered to exhibitors as soon as they can be engraved or filled in, which may take some weeks yet, as, according to the list, there is considerable work to be done. When ready for delivery, due notice will be given, by the Board of Managers, through the public press:

CLASS 1—SECTION 1.

Detrick & Eckart, for oscillating engine, silver medal.
S. C. Higgins, for horizontal engine, diploma.
Robert Blair, for working model horizontal engine, certificate of merit.
H. B. Martin, for oscillating, double piston steam engine, diploma.
Henry Tripp, for working model of locomotive engine, diploma.
Risdon Boiler and Locomotive Works, for California made steel boiler, diploma.
Etna Iron Works, for Bemis's patent grate bars, silver medal.
R. L. Harris, for Carvalho's steam superheater, silver medal.
J. L. Constable, for new mode of generating steam, certificate of merit.
H. L. Smith, for Dunbar's piston packing, diploma.
Miners' Foundry, for Hicks's engine, diploma.
Pacific Foundry, for horizontal engine, gold medal.
Union Foundary, for horizontal engine, silver medal.

CLASS 1—SECTION 2.

W. J. Tustin, for windmill, special diploma.
Altwood & Bodwell, for windmill, diploma.
E. O. Hunt, for model of windmill, certificate of merit.

CLASS 2—SECTION 1.

Formhals, for hydraulic blower, certificate of merit.
Goff & Bisbop, for California invented crank pin and cross head lathe, silver medal.
Marsh, Pillsbury & Co., for fan blower, certificate of merit.
N. Lamsden, for California inveated apparatus for making screwed hoops and shoes, diploma.
Aitwood & Bodwell, for model of self-lubricating journal, certificate of merit.
Peterson & Jones, for patent spring hammer, California invention, diploma.
Wm. Rudolph, patent turning lathe, certificate of merit.
C. F. Robinson, for Rose's patent tire upsetter, certificate of merit.
J. S. Detrick, for eccentric chuck, silver medal.
Kittredge & Leavett, for one punch and two pairs of shears, certificate of merit.
Hughes, Kimball & Co., for tire upsetter, diploma.
Andrew Spaulding, for watchmaker's lathe, diploma.
A. S. Hallidie & Co., for machine for making wire rope, California invention, diploma.
Nelson & Dohle, for drilling machine, diploma.

CLASS 2—SECTION 2.

F. A. Huntington, for shingle machine, diploma.
I. H. Small, for planing machine, special diplom..
James Hatch, for guides and guards for moldiug, California invention, certificate of merit.
J. W. Alesworth, for machine for beviling barrel staves, certificate of merit.
James Hatch, for improved mortesing chisel, California invention, special diploma.

CLASS 2—SECTION 3.

Coffin & Standish, for steam plow, California invention, gold medal.
J. Maiquis, for model of steam plow, certificate of merit.
J. and J. Ingham, San Jose, for gang plow, diploma.
F. V. Lamh, for vegetable root cutter, diploma.
M. C. Hawley & Co., for agricultural implements, diploma.
E. Rimhall, for gang plow, certificate of merit.
D. Winter & Co., for combined seedsower and cultivator, diploma.
Baker & Hamilton, for sweepstakes and gang plow, etc., silver medal.
W. H. Weister, for Randall's patent sulky rake, diploma.
Baker & Hamilton, for combined shaker, reaper and mower, diploma.
Dexter & Lamhert, for California made cultivator, diploma.
J. Price, for best hay press, diploma.
H. G. Pratt, for hay press, certificate of merit.
W. B. Reardy, for improved cultivator tooth, diploma.
A. Hunter, for best grain separator, California invention, diploma.
A. Hunter, for combined rake and loading machine, certificate of merit.
Russell & Erwin Manufacturing Company, for best self raking reaper, diploma.
A. C. Fargo, for improved wagon brake, diploma.
I. J. Huttabough, for Eagle hay forks, certificate of merit.
W. N. Hawley, for best hay cutter and single plow, diploma.

CLASS 2—SECTION 4.

Pacific Woolen Mills, for knitting machine, certificate of merit.
W. Lyne, for hair-picking machine, diploma.
J. Spaulding & Co., for carpet beating machine, certificate of merit.
Robert Hewston, for self-generating gas machine, certificate of merit.
Pioneer Woolen Mills, for steam weaving loom, certificate of merit.
George E. Butler, for family knitting machine, certificate of merit.
J. Neuman, for silk loom, diploma.

CLASS 3—SECTION 1.

J. B. Johnson, for best friction hoist, a California invention, diploma.
J. Hendy, for best concentrator, diploma.
Miners' Foundry, for McAuley's rope hose covering, diploma.

CLASS 3—SECTION 2.

J. Munson, for submerged pump, certificate of merit.
G. M. Gerrish, for submerged pump, diploma.
L. D. Craig, for globe hydraulic nozzle and coupling, California invention, diploma.
E. O. Hunt, for three California patent pumps, certificate of merit.
H. B. Martin & Co., for force pump, California invention, certificate of merit.
M. D. Laswell, for force pump, silver medal.
A. J. Smith, for Hudson's pump, certificate of merit.
Etna Iron Works, for patent steam pump, Dunbar's self-adjusting steam packing, diploma.
David Stoddart, for Cameron's steam pumps, certificate of merit.
O. J. Backus, for patent hose nozzle, diploma.
V. Cushing, for Excelsior force and suction pump, diploma.

CLASS 4.

Tubbs & Co., for California made rope, diploma.
T. F. Mitchell, for California made blocks and sheaves, silver medal.
George Howes & Co., for model of ship *Young America*, silver medal.
T. B. Rocher, for patent swivel shackle, California invention, certificate of merit.
W. M. Ryan, for model of vessel, certificate of merit.
E. T. Barlow, for patent anchor and cosin, diploma.
S. Marion, for model of a full rigged ship, certificate of merit.
Capt. Wylie, for steamship and model of ship, certificate of merit.
J. E. Thayer, for four models of ships, diploma; for surf boat (Norwegian), certificate of merit.
Mrs. A. Rogers, for model of steamship *Zoe*, diploma.
Gustave Jessen, for model of U. S. steamer *Shubrick*, certificate of merit.
J. C. Cousins, for two models of boats, diploma.

CLASS 5.

Church & Clark, for California made fireworks, diploma.
Snyder & Browning, for rifle, diploma.
San Francisco Percussion Match Company, for California made matches, diploma.
Pioneer Fuse Company, for California made fuse, diploma.
Liddle & Kaeding, for shotguns, diploma.
Wm. Rudolph, for gun lock, California patent, diploma.
Powder---yet to be reported on.

CLASS 6.

Not reported.

CLASS 7—SECTION 1.

Not reported.

CLASS 7—SECTION 2.

G. W. Cool, dental goods, gold lined vulcanite, certificate of merit.
D. S. Hutchinson, dental goods, special diploma.
H. W. Calvert, dental goods, silver medal.
Drs. Cogswell & Woodward, teeth on American vulcanite, diploma.
Dr. A. Foileau, orthopeoical instruments, California make, silver medal.
H. N. Cook, vest, artificial leg, diploma.

CLASS 8—SECTION 1.

Misigill & Cooper, California made horse shoes, certificate of merit.
Betts & Fooks, buggy springs, California made, diploma.
D. Jones, axletrees, California invention, diploma.
L. Chellis, house safes, California made, certificate of merit.
A. C. Taylor, California stove and range, diploma.
Pacific Rolling Mill, California forging, two lots, silver medal.
Jonathan Kittridge, best bank safes, diploma.
Kittridge & Leavitt, best finished safe, diploma.

CLASS 8—SECTION 2.

F. Schocner, spoon metal, California made, certificate of merit.
Pacific File Works, California made files, diploma.
W. C. Bussey, improved combination safety lock, diploma.
H. T. Graves, wire goods and safety strips, diploma.
H. J. Booth & Co., Quartz, shot and grain screens, certificate of merit.
W. A. Sublett, for improvement on window supporter, diploma.
A. M. Seaburg, for patent wood saw and stretcher, certificate of merit.
Wild & Fink, for bell hanging, California manufacture, certificate of merit.
Nelson & Doble, for blacksmith, miners and stone-cutters tools, diploma.
N. W. Spaulding, for circular saw inserted teeth, California invention, diploma.
J. Weichart, for edge tools, diploma.
B. Riley, for adjustable tongs, California invention, diploma.
J. Gray, for broomwire, California invention, diploma.
Charles Watson, for tools for cutting threads, diploma.
P. Quigley, for California made carpenters' tools, certificate of merit.
American Saw Co., for Emerson's patent saw teeth, certificate of merit.
J. H. Culver, for improved calliper, California patent and manufacture, certificate of merit.
Pacific Saw Co, for best display California made saws, silver medal.

CLASS 8—SECTION 3.

Wm. T. Garratt, for bells, cannon and brass goods California made, silver medal.
Garvey & Kimball, for California made gongs, bells, etc., certificate of merit.
C. E. Blake, for safety-valve for fire hose, California invention, diploma.
C. Allison, for hose couplings, California invention, certificate of merit.
Gallagher & Weed, for California made brass goods, diploma.
Wild & Fink, for California made gongs, diploma.
P. Caduc, for water and steam cocks, California invention, certificate of merit.

CLASS 8—SECTION 4.

Milliken & Johnson, for self-soldering cock for tin cans, etc., California invention, diploma.
R. P. Thomas, for submerged coffee boiler, California patent, certificate of merit.
C. Newman, for coal oil lamp burner, California invention, diploma.
San Francisco Lead and Shot Works, for lead manufactures and smelting works, gold medal.
Holbrook, Merrill & Co., tin and copper ware, diploma.

CLASS 9.

Menant's Asphalum Company, for asphaltum, certificate of merit.
Benecia Cement Company, for cement, diploma.
Pacific Glass Works, for California made glass, diploma.
Pacific Concrete Company, for sidewalks and drain pipes, diploma.
Noble & Gallagher, for embossed glass, diploma.
Thomas O'Neil, for ornamental cut and ground glass, certificate of merit.
John Mallon, for best cut glass, diploma.
San Francisco Glass Works, for California made glass, gold medal.
R. Mills, for stained glass, diploma.
A. Massaro, for engraved glass, diploma.
Golden State Pottery, Antioch, for California made pottery, silver medal.
Skinner & Flick, for sanitary pipe, California invention and manufacture, silver medal.

CLASS 10—SECTION 1.

I. E. Thayer, for California laurel wood, diploma.
Sheppard & Carroll, for California made lasts, diploma.
J. G. North, for stern knee for steamboat, certificate of merit.
J. W. Luisley, for hat and wig blocks, certificate of merit.
A. E. H. Sturcken, for improved window frames, diploma.
James Behrens, for tesselated pavement, certificate of merit.
Bryant & Strahan, for carved sideboard, silver medal.
J. D. Boyd, for California laurel, silver medal.
Snow & Roos, for picture frames, diploma.

CLASS 10—SECTION 2.

Figel Bros., for California made brushes, diploma.
Miss A. W. McClelland, for Peterson's patent washing machine, diploma.
Feldman & Company, for California made brushes, certificate of merit.
Elam & Howes, for California made wooden ware, gold medal.
Thurnauer & Zinn, for willow ware, certificate of merit.
F. B. Lamb, for Pioneer washing machine, certificate of merit.
Pacific Barrel and Keg Company, for California made barrels and kegs, diploma
P. Rasmunson, for California washing machine, certificate of merit.
California Wine Cooperage Company, for California made wine casks, silver medal.
J. N. Seeley, for churn and wringer, certificate of merit.
Houghton, certificate of merit.

CLASS 11.

North Star Mining Company, for specimens of ore, diploma.
G. Kustel, for specimens of ore (foreign.) silver medal.
M. Lane, for specimens of silver ore, certificate of merit.
M. Scott, specimens copper, silver and gold ores from Morning Star mine, Alpine county, diploma.
Oregon Iron Company, for samples of iron ore and pig iron, silver medal.

CLASS 12.

Crane & Brigham, for California sulphate of copper, diploma.
Standard Soap Company, for chemicals, diploma.
Bay View Chemical Works, for California made sal soda, certificate of merit.

CLASS 13.

Vanderlice & Co., for California made silverware, gold medal.
John Martell, for silver-plated coach material, diploma.
P. A. Giannini, for gold watches, diploma.
Mrs. C. Cook, for hair jewelry, diploma.
F. Hotlander, for invented watch alarm, certificate of merit.
San Francisco Plating Works, for plated ware, diploma.
C. H. Hain & Co., for silverware, certificate of merit.
William Lynch, for coat-of-arms, certificate of merit.
H. Weuzel, for California made clock, diploma.
Braverman & Levy, for silverware, certificate of merit.
Mrs. B. Uzynski, for hair jewelry, certificate of merit.
F. Heinze, for universal clock, diploma.
C. E. Collins & Co., for California made clock, diploma
R. F. Rhocchiecoli, for California plated and gilded ware, silver medal.
Haynes & Lawton, for California silver-plated ware, silver medal.
Mrs. Bolander, hair jewelry, certificate of merit.
O. B. Oakley, silver-plated ware, diploma.
Mrs. C. Cook, for landscape, hair jewelry, diploma.

CLASS 14.

F. Serigini, Pacific Business College, for ornamental penmanship and drawing, diploma.
California Business University, for commercial penmanship, diploma.
L. M. Fernandez, for specimen of ornamental penmanship, certificate of merit.
Miss A. W. McClelland, for wood engraving, diploma.
J. B. Gronppe, for wood engraving, (boy 17 years,) certificate of merit.
J. Breidensiem, for jewelry boxes, diploma.
George B. Hitchcock & Co., for copying presses, diploma.
F. M. Trueworthy, for stencil cutting, diplomn.
H. H. Bancroit & Co., for publications, silver medal.
Cubery & Co., for printing, diploma.
F. G. Edwards, for manufacturing wall paper, diplomas.
A. Foreman, for improved type macoine, siver medal.
Palmer, Knox & Co., for press and inking machine, diploma.
S. P. Taylor, for California made paper, gold medal.
Teuoner & Hoffman, for jewetry boxes, certificate of merit.
W. B. Cooke & Co., for assortment blank books, silver medal.
G. B. Hitchcock & Co., for California-made pocket-books, diploma.
J. G. Hooge & Co., for paper ruling and blank book-binding, special diploma.

CLASS 15.

Geo. P. Kimball & Co., for hnggies and wagous, gold medal.
Albert Folsom, for hnggies and wagons, silver medal.
Gallagher Bros., for hutcher cart, diploma.

CLASS 16—SECTION 1.

Main & Winchester, for saddlery and harness, gold medal.
G. Vellinger, for saddles, diploma.
M. M. Cook & Co., for California made collars, diploma.
F. T. Honghton, for side saddle, diploma.
J. Hamilton, for circus performer's saddle, certificate of merit.
A. P. Beatty, for bullion bridle, certificate of merit.

CLASS 16—SECTION 2.

L. Price, for California made ladies' boots and shoes, diploma.
W. F. Burke, for ladies' boots, galters and slippers, special diploma.
Hobart, Wentworth & Co., for men's heavy boots and shoes, diploma.
Buckingham & Hecht, for miners' boots and heavy brogans, diploma.
L. Hofman & Co., for California calf and kip skins, diploma.
Tyler, Curtis & Co., for California calfskins, kips, morocco and sole leather, certificate of merit.

CLASS 16—SECTION 3.

M. M. Cook & Son, for leather belting, diploma.
J. J. Fulton, for fire hose, diploma.
E. Galpin & Co., for leather bags and satchels, diploma.
J. Pointer & Co., for sole leather trunks, diploma.

CLASS 17.

Horst & Vishy, for decorative painting, diploma.
J. W. Cherry, for sign painting, diploma.
W. Patterson, for metallic signs, certificate of merit.
G. A. Brash, for grained doors, silver medal.
John D. Boyd, for wood polishing, diploma.
P. Gihot, for block lettering, certificate of merit.

CLASS 18.

Wigmore & Palmer, for school furniture, diploma.
Wigmore & Palmer, for Pompeian desk gold medal.
N. P. Cole & Co., for California made furniture, silver medal.
Goodwin & Co., for upholstery, silver medal.
Whittier & Fuller, for mirrors, silver medal.
Jones & Wool, for carved frame, diploma.
McElwee & Ackerman, for carpets, curtains, etc., certificate of merit.
Philip Hinckle, for patent spring bed, certificate of merit.
Krnger & Slocum, for American spring bed, certificate of merit.
W. L. Torrey, for spring bed, California invention, special diploma.
Eureka Hair Company, for Eureka hair, diploma.
Pacific Elastic Sponge Company, for elastic sponge beds, certificate of merit.
Schlueter & Voloerg, for paper drapery, certificate of merit.
P. Leisenfeldt, for billiard tables, silver medal.
Johnson & Best, for secretary and book case, certificate or merit.
L. Castagnino, for California inlaid furniture, certificate of merit.
S. Tounar, for rustic settees and chairs, certificate of merit.
W. A. Byrnes, for cricket and base ball hats, certificate of merit.
G. Rolland, for California made inlaid floor, certificate of merit.
C. Newbia, for laurel wood writing desk, diploma.
C. D. Hinckley, for wire bed springs, diploma.
J. D. Patrick for California invented bowling alley, certificate of merit.

CLASS 19—SECTION 1.

M. Heverin, for marble mantels, diploma.
Thomas Robinson, for California grindstone, diploma.
E. T. Steen, for California artificial stone, certificate of merit.

CLASS 19—SECTION 2.

P. J. Devine, for marble bust, silver medal.
P. Mezzara, for plaster reliefs and busts, diploma. Same, for cameos, silver medal.

CLASS 20.

Pacific Oil and Lead Works, for California made oils, gold medal.
O. A. Olmstead, for mineral paints, silver medal.
Epes & E. H. R Ellery, for India-rubber paint, diploma.
J. B. Parsons & Co., for Bowman's Washing Fluid, certificate of merit.
Santa Cruz Glue Company, for neatsfoot oil and glue, diploma.
San Francisco Candle Company, for California made candles, silver medal.
Standard Soap Co., for family and fancy soaps, silver medal.
H. Lake, for California blacking, diploma.
J. Herkimer, for water-proof blacking, diploma.
Eureka Soap Co., for family soap, certificate of merit.
C. G. Kelly & Co., for washing fluid, diploma.
J. J. Hucks, axle grease, diploma.
Hill & Perreynes, for copper paint, diploma.
G. Lewis, for olive oil, diploma.

CLASS 21—SECTION 1.

William Marple, for (Cascade Lake) best landscape in oil, diploma.
George B. Butler, for best portrait in oil, diploma.
George H. Burgess, for best portrait in water colors, diploma.
Charles C. Nahl, for (The Surprise) best animal or figure painting, diploma.
Otto Schrader & Brother, for best frescoe and decorative painting, diploma.
S. M. Brooks, for (a string of fish) best still life painting, diploma.
T. Renault, for (Horses Fighting) best pencil drawing, diploma. Exhibitor 13 years old.

CLASS 21—SECTION 2.

F. E. Mills, for anthophotoscope, silver medal.
C. E. Watkins, for photographic views, silver medal.
Snip Selleck, for plain photographs, silver medal.
H. W Vaughan, for colored photographs, silver medal; for retouched photographs, diploma.

CLASS 22.

Jacob Zech, for best upright pianos, gold medal.
G. Rudolph, for upright pianos, silver medal.
Jacob Zech, for square piano, diploma
C. C. Keene, for musical instruments, diploma.
John G. Dawes, for flute, diploma.
M. Lawlon, for toy piano, certificate of merit.

CLASS 23.

Alexander Mackay, for rag carpets, diploma.
Pacific Woolen Mills, for knit goods, gold medal.
Marysville Woolen Mills, for blankets and flannels, certificate of merit.
Oakland Cotton Mills, for cotton goods, diploma.

CLASS 24.

Adolph Muller, for best display of manufactured fure, silver medal.
D. Norcross, for best California made regalia and military goods, diploma.
H. Liebes, for display of furs, diploma.
T. R. Johnson, for California made regalia and military goods, certificate of merit.
Blake & Co., for California made regalia and military goods, certificate of merit.
S. Figel, for boys' clothing, diploma.
J. Figel, for boys' clothing, certificate of merit.
S. Reinstein, for California made clothing, diploma.
J. Lancaster, for men's pants, certificate of merit.
H. M. Heineman, for neckties, diploma.
J. De Barr, for California made umbrellas, diploma.
J. Alsop, for California made parasols, certificate of merit.
Ladies' Coöperative Union, for California made shirts, diploma.
M. Eisberg, for California made shirts, certificate of merit.
Ladies' Coöperative Union, for dressing-gown, diploma.

CLASS 25.

L. Prevost, for best display of cocoons, silver medal.
R. Williamson, for mulberry trees, diploma.
J. Neuman, for silk manufactory, diploma.
J. Neuman, for silk winding machine, silver medal.

CLASS 26.

Meyer Jonasson & Co., for cloaks, silver medal.
Mrs. Thomas J. Winship, for millinery, silver medal.
Ladies' Coöperative Union, for general needlework, silver medal.
S. Rosenblatt, for dresses and shawls, certificate of merit.
Mrs. Capt. J. A. Johnson, for affghan embroidery, diploma.
Mrs. W. C. Wilson, for patchwork quilts, diploma.
Miss A. Good, for silk quilt, certificate of merit.
Mrs. G. S. Harris, for leather and seed flowers, certificate of merit.
T. Entz, for perforated stamping patterns, diploma.
Pacific Straw Works, for straw goods, diploma.
Mrs. A. Bolander, for embroidery and stamping, certificate of merit.
Mrs. C. S. Sullivan, for embroidered initials and stamping, certificate of merit.
Miss F. Breese, for tatting parasol cover, certificate of merit.
Mrs. F. Gabriel, for fish scale embroidery, certificate of merit.
Currier & Winter, for seaweed, certificate of merit.
John F. Snow, for cleaned gloves and furs, certificate of merit.
Mrs. J. F. Clement, (aged 60 years,) for tatting collars, diploma.
Mrs. Barringer, for Mrs. Curtis's method of dress cutting, diploma.
Miss Veronica Crane, (13 years old,) for worsted work, diploma.
Miss F. R. Jacks, for needlework collar, certificate of merit.
Mrs. Juliana Bayer, Sacramento, for raised embroidery, certificate of merit.
Clans & Co., for artificial flower baskets, certificate of merit.
Mrs. E. T. Newton, for carpet and rug, diploma.
Mrs. A. S. Knaop, (aged 60 years,) for table covers and spread, diploma.
Miss T. McClure, for phantom wreath, certificate of merit.
Mary Haviland, for pencil sketch and wreath, certificate of merit.
Mrs. G. Mohrent, for bedspreads and baby's shawl, diploma
Miss A. Murphy, for patchwork quilt, certificate of merit.
Mrs. P. C. Poole, for worsted worked sofa pillow, certificate of merit.
Jacobs, Newman & Co., for California made hoop skirts, certificate of merit.
Golden City Straw Works, for straw and fancy bonnet frames, certificate of merit.
Miss A. Van Ronn, for counterpane and table covers, certificate of merit.
Mrs. Watson, (aged 80 years,) for knitted tidy and stockings, diploma.

[Continued on Page 206.]

Mechanical.

A New Dynamometer, or Force Measurer, from Oregon.

A Dynamometer is an instrument for measuring force, in mechanics. Its use is to determine the force used or necessary to be used in driving any given machine or part. The want of an instrument of this kind, which would accurately registor power, has been felt by mechanics ever since the invention of machinery, and hundreds if not thousands of unsuccessful attempts have been made to construct such an one. An editorial writer in the *Scientific American* mentions some of the errors into which the best engineers have always fallen in calculating the powers absorbed by vented machinery, and deplores the fact that no accurate method of measuring force has ever been found. Itsays: "Thorough method of calculating the amount of power delivered or transmitted, by the width of the driven belt - a plan which was common enough a few years ago and may be now—is as ridiculous and as far from the truth as the formula of the astronomical instructor who taught the pupils, in estimating the distance of the fixed stars from our planet, to guess at the distance and multiply by four." A paper by one of the most eminent English engineers, on this subject, after mentioning and describing two of the best instruments in use, says: "We find ourself compelled in the face of those two best indicators yet made, to declare that an absolutely perfect instrument of the kind remains yet to be invented." There seems to be no difficulty in measuring force exerted in a straight line; the trouble is to calculate power exerted in a rotary direction, especially where it is irregular or eccentric, as in cam movements. We have some assurance that this difficulty is about to be overcome by an invention of our fellow-townsman, John W. Sutton. He has constructed an instrument which, though notcomplete, is in operation at the Willamette Iron Works, and promises the most flattering and astonishing results. A number of mechanics who have examined it pronounce the most favorable opinion of its accuracy, and it would seem that it can scarcely fail to take the leading position among all the rotary dynamometers known. It would be useless to undertake an intelligible description of it without ample means of illustration; but we can give a general idea of the principle upon which it works. It consists of two disks placed upon a shaft and a hollow shaft so that they may move relatively without appreciable friction. One of these disks is fastened to the driving pulley; the other to the main shaft. The two disks are attached by means of spiral springs. When the driving pulley starts, it carries the attached disk and that in turn, by means of the spiral spring connection, drags after it the other disk which is attached to and turns the shaft. The springs, of course, are drawn out by the advance movement of the first disk and the lagging movement of the other. The relative movement or change of position of the two disks, by meaus of cog gearing within moves a cogged rack, back and forth as the power is increased or diminished and as the two disks change their relative positions. The rack moves a collar along the shaft and by an indicating point registers the power. The spiral springs are drawn or elongated, and contracted according as the strain of the driving power and the resisting machinery is greater or less. The disks change relative positions in exact proportions, and every change, however minute, is marked by the indicator upon the gauge. Thus if it be known how much power it requires to elongate the springs a given distance, it becomes a simple mathematical calculation involving only rules well known to engineers, to determine the force applied, or what is equivalent, the resistance of the machinery. Mr. Sutton's instrument has a gauge based upon these calculations, which may be made to show at any instant the number of horse powers, or thousands of pounds, or even pounds, of force exerted. He has filed a *caveat* for a patent and taken all the necessary steps to procure it. The model may be seen for a few days at the Willamette Iron Works, where it is now being finished. All the mechanics who have seen it say that Mr. Sutton has certainly made an important and valuable discovery.—*Portland Oregonian.*

Steel Boilers.—Boiler plates made of cast steel have recently been subjected to a series of practical experiments, in order to test their value as compared with those made of wrought iron. The trials were made at Harkett's Ironworks, in Westphalia, and the results are reported to have been decidedly in favor of steel.

Cheap Steam Engines.—An English manufacturing firm has recently brought out a novelty in steam engines, as far as relates to the price, in a two-horse power horizontal engine, of good construction, which is sold for the sum of eighteen pounds. Considerable credit is due to the manufacturers of such an engine, for the skill required in designing it to meet such conditions. This is the line of march that Progress must take in regard to the steam engine.

Bridging the Mississippi at St. Louis. The construction of a bridge across the Mississippi has been commenced under the engineering of Capt. J. B. Eads, who has selected a spot where the river is 1,500 feet wide, and proposes three spans, the center of which is 515 feet, and the two side ones 497 feet each. The bed of the river is a shifting mass of sand overlying a bed of rock to a considerable depth, involving the construction of a pier 145 feet in height from the rock to the lower roadway.

Iron Smelting Operations in Mexico.—An enterprising English company, after overcoming almost insurmountable difficulties, have established two extensive ironworks at Zimapan, in Mexico. In these works steady employment is given to between 500 and 600 native laborers, and over 600 tons of iron are annually manufactured into bars or other varieties of merchantable iron, and sent to the City of Mexico over a difficult mountain road, built and kept in condition by this company, at their own expense, the Government never contributing in labor or money to its construction.

North of China Gold Mines.

Dr. Macgowan, who is occupied in preparing a work in Chinese on "Mining and Metallurgical Opperations for the Government of China," sends us the following information respecting the newly discovered gold mines in the north of China:

The intelligence of the discoveries of gold in the Promontory of Shantung will have reached San Francisco by preceding mails, and have occasioned, I apprehend, some excitement among the hardy, restless and adventurous miners of California and adjacent mining regions. I shall not say that reports have been transmitted to California and Australia with the design of creating an excitement amongst their nomadic inhabitants, but I can affirm that there is no concealment on the part of many here of the desire they entertain for an arrival of Californian and Australian fillibusters; nor is the object of that desire concealed, that object being the employment of miners to revolutionize the country at least to the extent of overthrowing Chinese exclusiveness; in other words, to render nugatory such treaty obligations as are distasteful to foreigners. The well-being of those who are to bring about those changes is as little considered as the feelings of Chinamen in the matter.

Considerations of this nature, and the requirements of good faith, have induced the Consuls of the various treaty powers to notify their nationals that until the Imperial Government sees fit to change its policy, they will aid the Chinese in enforcing the laws. As these laws prohibit the working of the mines alike to natives and foreigners, our mining friends should consider well the situation before expatriating themselves.

There is another consideration which deserves attention, and which many miners can appreciate even in California and Australia: Chinamen can afford to work cheaper than white men, and it is likely that with the additional advantage of being at home, he can so compete with the foreigner as to impoverish the latter.

It has been predicted that within a few months we shall have a rush of miners here, numbering some two thousand. The prophesy was to effect that immigration, and if the mines should prove unproductive the men thus allured are likely to be great sufferers. With regard to the productiveness of the diggings, nothing can be positively affirmed. It is almost demonstrated that rich auriferous quartz is abundant; also, silver, copper and coal. But whether or not the miner, whose capital is his hands, can delve and live, is more than any man can say at present.

On these grounds I counsel American miners to stay at home.

Scientific Miscellany.

Familiarity With and Uses of Electro-Magnetism.

Were it not for the two great discoveries of telegraphy and electro-metallurgy the greater portion of our knowledge of electricity would be confined to scientific men. From unnumbered experiments that have been made, it seems the generation of electricity is a phenomenon generally attendant upon the contact or conjunction of two materials of different natures; thus, not only may it be derived from the decomposition of zinc in an ordinary galvanic battery, but also by the simple contact of the zinc with another metal, as with iron, the tension of the electrical current being in either case proportioned to the rapidity with which the zinc is oxidized. In like manner experimental batteries have been made simply of alternate layers or slices of two different kinds of vegetables, and also of alternate disks of two different varieties of wood. Pins or bolts of one variety of wood driven into the hulls of ships formed of another variety, have been found to produce currents of appreciable strength, and sufficient to affect the adjacent metallic sheathing.

Amongst the later applications of electricity to utilitarian purposes are the Saxby method of detecting flaws in iron, by which the deflection of the needle when passed along an iron bar or shaft indicates the want of homogeneousness in the metal, and the resulting unreliability of the same; the electric test for the detection of adulteration in oils, devised some years ago by a French savant, and since extended by an English experiment founded upon the discovery that the number of vibrations and the degree of resistance of the magnetic needle, when made to form part of an electric current, are affected by a given oil to a greater or less degree, according as the latter is more or less pure; and the experiments made by M. Duchemin, under the authority of the French Governmeat, relative to the practical use of the electricity generated by the destruction of zinc in seawater, in which he has succeeded in ringing an electrical bell for two months continuously, the success thus far attained encouraging the projector to propose other uses by similar means, as the protection from rust of the bottoms of iron-clads, by insuring communication between the armor and a powerful pile placed in the sea-water.

The Japanese Earthquake Alarm not Reliable.—The following experiment was made by Mr. Henry G. Hanks, of this city, for the purpose of testing the reliability of the "Japanese Earthquake Alarm." We give his own words:

"Having heard the Japanese instrument described, I made an experiment to satisfy myself whether it was true or otherwise. I procured a small but powerful magnet which I suspended from the ceiling of my bed-room over my table. To the keeper I hung a small tin pan, like the pan of a balance. This I loaded continuously with weights until I had ascertained the full power of the magnet. I then hung a bar of iron of equal weight to the maguet without any other support than the attraction. It is evident that the slightest decrease of attractive power on the part of the magnet would have allowed the pan to fall. The weight of the bar was 2,578 kilogrammes—over five and a half pounds avoirdupois. This arrangement remained suspended for several months, the bar pointing steadily to the magnetic north. During this time we had several earthquakes. Even the motion did not shake down the suspended bar. From this experiment I am led to believe that the Japanese indicator is a myth, or that the earthquakes are governed by different laws in Japan than they are on this side of the Pacific. I have since conversed with parties who have resided some time in Japan, upon the subject. They have all heard of it, but I have failed to find any one who has seen it. I wish the "story" could be traced to its source, for such a statement should not go without contradiction. I do not know what such an earthquake as that lately experienced in South America might do, but my own experiments have proved to me that our ordinary California earthquakes do not effect the attractive power of the magnet in the slightest degree."

Artificial Mineralogy.—The following receipt for a foundation glass to make artificial precious stones, and the mineral coloring matter to be added to make imitations of particular minerals, are instructive to the student of mineralogy: M. Elsner recommends tho taking of 45·7 grammes of pure quartz, 22·8 grammes of pure and dry carbonate of soda, 7·6 grammes of borax, 3·4 grammes of niter, and 11·8 grammes of minium. These ingredients, reduced to a fine powder and well mixed, are brought to perfect fusion in a Hessian crucible over a charcoal fire. To color this mass add, for sapphires, 0·106 grammes of carbonate of cobalt; for emeralds, 0·53 grammes of oxide of iron; for amethysts, 0·265 grammes of carbonate of manganese; for topaz, 1·59 grammes of oxide of uranium. In all cases the fusion must be perfect, or a clear glass will not be obtained. Cutting greatly improves these imitations.

Carbonization of Wood.—M. Gillot, in his memoir to the French Academy of Sciences on this subject, says the only condition essential for the production of good charcoal, is that the operation shall proceed slowly. The decomposition of wood commences at about the boiling point of water. In this way a given amount of wood will yield about two-thirds its weight of charcoal, and seven or eight per cent. of acetic acid.

Manufacture of Sulphuric Acid.—A new process for the production of sulphuric acid has been patented in France by MM. Tardani and De Susini. Its great recommendation is that it dispenses with the large leaden chambers. The sulphur or pyrites is burned in compressed air, and the sulphurous acid is first washed to free it from arsenic, etc., and is then brought into contact with the nitric vapors in a small leaden chamber of peculiar construction.—*Gas Light Journal.*

Charcoal Dust or Lamp-black as a Disinfectant.—The disagreeable smell peculiar to india-rubber may be got rid of by means of charcoal and, better still, by lamp-black, which, as is well known, has the property of absorbing gaseous substances. The articles to be disinfected are put into a close vessel, covered over with charcoal-dust, and then exposed for a few hours to a temperature of from 60 to 70 degrees Centigrade, by means of a water bath. When the articles are taken out the charcoal-dust is brushed off, and it will then be found that they have lost every trace of bad smell.

California and Nevada Drying up.—At the recent meeting of the Scientific Association at Chicago, Prof. W. P. Blake read a short paper "on the gradual desiccation of the western portion of North America." He said that the interior lakes in the chain of the Sierra Nevada were giving ample evidence of wasting away, being surrounded by water-lines, old beaches and terraces. Some of the existing lakes had broad tracts of lacustrine clay, extending a considerable distance from their present shores. The lakes of Mexico have also much narrower beds than formerly, and there were evidences of the decrease of water in them within historic times. There were no traces of volcanic action or any paroxysmal movement to produce so great a change. It was impossible to avoid the conclusion that the gradual disappearance of these vast lakes was due not to changes of level but to grand climatic changes,—to a gradual decrease of precipitation which not only appeared to be continental but to be world-wide, inasmuch as similar conditions were found in Central Asia and elsewhere. He referred to the gradual extinction of glaciers from the south northward, and regarded this as connected with the decrease of precipitation.

Within the last year business in Folsom has increased to a considerable extent; new buildings have been erected, and real estate has taken an upward tendency, and there has been a steady increase in population, and confidence in the future growth and prosperity of the town has been fully established.

There are 13 steam threshers now at work in Salinas Valley, Santa Cruz county, threshing out an average of 500 bushels per day, and there is a demand for at least eight more.

[Reported for the Mining and Scientific Press.]

Fifteenth Annual State Fair.

The attendance at the Fair this year is uuusually large, and the display of articles on exhibition in the various departments is exceedingly fine and creditable to the State. Many articles were late in making their appearauce here, owing to the continuance of the Mechanics' Institute Fair at San Francisco, hardly giving time to transport and arrange them in the time intervening hetween the closing of one and the openiug of the other. Notwithstanding this necessary delay, the articles made a good display on Friday, and on Saturday everything was in successful operation. The attendance at the Hall during the day is not large, which is no douht owing to the attractions at the Park, where the stock is on exhihition, and one or more races come off every afternoon at 2 o'clock. In the evening crowds assemble in the pavilion, filling the various rooms to such an extent as to make locomotion exceedingly difficult. In my opinion, the huilding is much too small, not to say inconvenient, for the proper display of the increasing uumher of articles which seek exhibitiou at all our Fairs. But this will no doubt he remedied another year, by ample additions to the present huilding, as I understand the Society has ample room adjoining for all future needs.

Willis' Band, of San Francisco, furnishes the music at the pavilion, which is a guarantee that visitors will he well entertained.

On Thursday evening the Introductory Address was delivered hy the President of the State Agricultural Society, C. F. Reed, of Yolo. He congratulated the farmers of the State on their prosperous coudition in the following langnage: "Our farmers are not only doing well, and laying up a competency for themselves and famililies, but they are absolutely becoming rich. An abundance of crops and highly remunerative prices are filling their coffers with gold and silver; enabling them to improve and beautify their farms and homes, to build uew and commodious dwellings and barns, to purchase and use the most approved labor-saving machinery in the cultivation of their land and the gathering and saving of their crops; to supply their families with all the necessarics aud luxuries enjoyed by older and less favored communities. As prospers agriculture, the great fountain of all wealth, the great mother of all other occupations, and promoter of all civilizatiou, so prosper the towus and cities, the State and the entire people." The address was an ahle one, and was listened to with evident interest by all who were present.

I shall not attempt to give a list of even the most prominent articles on exhibition in any department, much less to attempt to describe them. Many of the articles exhibited here, were on exhibition at the late Mechanics' Institute Fair in San Francisco, and were fully described in the Daily Fair Press; in fact, to leave out all those articles, would be to materially curtail this exhibition. But this was to be expected.

THE MACHINERY DEPARTMENT.

This department of the exhibition is not as fully represeuted as I expected to find it. The main propelling power is furuished by Wright's Pateut Variahle Cut-off Steam Engine, built at the Pacific Iron Works, San Francisco, and was ou exhibition at the Mechanics' Institute Fair, where it was much admired, and received a gold medal as the best steam engine entered for competion there. It was fully described iu a recent number of the Press.

Numerous diminutive steam engines are scattered through the building, doing good service as motors.

J. Hendy, of San Francisco, has ou exhibition two of his improved concentrators, which are in practical operation. These concentrators receivcd a diploma at the Mechanics' Instute Fair of San Francisco.

There are a large numher of pumps on exhibition, and considerahle interest is manifested as to the merits of the several inventions. Those representing these pumps are always ready to point out what they consider their superior merits, and each pump is extolled in a manner that wonld do credit to a modern auctioueer. We noticed the American and Gerrish suhmerged pumps in operation. Mr. M. D. Lasswell, of San Francisco, has a numher of pumps on exhibition. These pumps make a fiue display, and are one of the hest features in the machinery department.

Pierce's patent incline elevator is on exhibition, and is much admired for its ingenuity and novelty.

J. B. Johnson, of San Francisco, has on exhibition a patent friction hoist, for which he received a diploma at the Mechanics' Institute Fair.

AGRICULTURAL IMPLEMENTS.

The display of agricultural implements is very large and creditahle. I noticed articles from Messrs. Baker & Hamilton, of Sacramento, Treadwell & Co., of San Francisco, Wehster Bros., of Stockton, and some others, who display a large assortment of all kinds of implements, from the gang plow, which first turns up the soil and prepares it for receiving the seed, to the reaper and header, which gathers the ripened grain, and the thresher, which completes the harvestiug operation. I also noticed in this department, Walton's patent iron-headed hay-fork, which seems admirahly adapted for the purposes for which it is designed. A caveat has been filed for this invention.

IN THE UPPER HALL

are exhibited miscellaneous articles in great profnsiou and variety. The sewing machine department is represented by all the different inventions, and there is sharp competition. The Art Gallery is well filled with paintings and photographs of superior merit. The manufacture of silk by the Messrs. Newman, of San Jose, or the State at large, as they themselves express it, is a very interesting feature, as it was at the Fair in San Francisco. The exhibition of cocoous is also very numerous and fine. It would take much space to enumerate half of the prominent articles that are tastefully and profusely displayed in this room. The Pioneer and Mission Woolen Mills of San Francisco, make a magnificent display of their goods. But I will not further particularize; suffice it to say, that the exhibition is pronounced superior to any of its predecessors in this department.

I noticed in a small room adjoining the the upper hall, a circular iron-clad floating battery, designed for harbor defence, by R. Rutter, of Vallejo. It is a neatly executed model.

IN THE LOWER HALL

are displayed the fruit, vegetables, and numerous manufactured articles. There was not so large a display of fruit as I expected to find here. The fruit, such as apples, pears, peaches, plums, etc., was very fine though not extensive. Grapes were in great ahuudance and very fine. We doubt if there was ever exhibited at a State Fair anywhere, a greater variety than is here displayed. The vegetahle kingdom was represented by giants; squashes of such huge dimensions that I will not even give the figures boldly painted on their plump sides, were laid upon the well supported tables; beets, that looked more like the underground growth of the forest, than of the vegetable kingdom, were here shown; but I need not give a description of these vegetahles, for auy one who has spent six months in California, has seen their counterparts in our markets.

The American Saw Company, and Pacific Saw Company, of San Francisco, are well represented, the former, we understand, only for exhibition, the latter for competition with any and all saws, either of foreign or home manufacture.

THE STOCK.

At the Park there is a fine display of stock, consisting of horses, horned cattle, sheep, Cashmere goats, swine, poultry, etc. At no previous exhibition of this Society, I am told, has there heen so fine a collection of thorough hred horses. Norfolk and Lodi are herc, and are exercised in front of the judges' stand every day. They are prohahly the finest horses of their class on this continent. The stock on exhibition is all very fine, and would do credit to older States than ours.

THE STEAM PLOW

of Coffin & Standish, of Martinez, attracts a good deal of attention here. It is exercised on the track to show its propelling power, and hefore the Fair closes will he put to practical test in plowing. The operation of this plow has heen so recently fully described in the columns of the Press, that I need not speak of it further than to mention its presence here.

Sacramento, Sept. 21, 1868. S.

Scientific Reconnoissance of Russian America.

We were much gratified on Thursday to meet Mr. Wm. H. Dall, late Chargé of the Russian American Telegraphic Scientific corps, shortly after he had stepped ashore from the schooner Francis L. Steele, 18 days from the Fox Islands, and the month of Yucon river, Behrings Straits. Mr. Dall was one of Prof. Agassiz's former pupils, and he has shown himself quite an enthusiast in science, especially in the departments of geology and zoölogy. Bronzed and rusty in appearance, he reminded us strongly of the little Frenchman Du Chaillu, as he looked when he landed at New York fresh from his first African adventures, and before the world knew anything about him and his gorillas. Full of narrative of the most wonderful adventures, the explorer and real adventurer does not realize himself how eloquent a simply told story becomes to the listener. Mr. Dall went out with the Western Telegraph Expedition in 1866, having previously spent two or three winters in San Francisco; and most of the time since then he has been traveling through and surveying the very heart of Russian America—not Sitka, but that far northwestern corner of the continent which fronts on Behrings Straits, and which is drained through its center by a great river flowing nearly due westward, occupying a hasin nearly as large as that of the Mississippi river. This is the *Yucon* river, and a country which is marked "unexplored" on the hest maps that can be had.

Bark or skin canoes and dog sleds are the modes of conveyance. Kotzebue Sound on the Arctic, was a point that Mr. Dall conld not quite reach, because he "got out of dog feed." We did not think of interrupting him to ascertain what that was composed of.

When Major Kennicott died, Mr. Dall remained in charge of the scientific corps; it being a year before they knew that the telegraph enterprise was abandoned. The winter of 1866-7 was spent at Nulato, in the interior, about 700 miles up Yucon river, or 220 miles from Norton Sound, on the Behring sea, by portage overland. In the spring of 1867, Mr. Dall continued his journey up the Yucon, 600 miles further, to a Hudson Bay Company's fort, kept by a Scotchman with the healthy sounding name of McDougal. This was on the borders of Russian and British America, not far from the Arctic ocean. Mr. Dall seems to have convinced Mr. McDougal that he and his Esquimaux subjects were located just a little inside of the United States line.

Returning to St. Michael's Bay, at the month of the Yucon,—a canoe voyage of 1,300 miles,—he first learned, in the fall of 1867, that the Telegraph Company had given up their designs. But as the work which Mr. Dall had laid out for himself was not completed, he immediately resolved to continue it at his own expense. The plan was to make a geological reconnoissance of the country, and to collect as many zoölogical and other specimens from those regions as possihle, for the Smithsonian Institute. The next year he went up to Nulato again, to fill in gaps in his survey, where the mosquitos seem to have been too thick for scientific observations. On getting to the mouth of the Yucon in the summer of 1868, he amused himself by shooting, and preparing specimens, till one day an Indian came along and told him that two American "ships" were in Norton's Sound. Thereupon there was a hasty packing up, the Francis L. Steele was duly reached, and at the same time an opportunity was found to talk English again; Russian and Indian having been the only means of communication for months, as Mr. Dall had heen latterly traveling alone amongst the Indians. The schooner was trading on behalf of the Pioneer Fur Company, which is composed of men who were in the employ of the Western Union Telegraph Company.

Reference heing made, incidentally, to the late Mechanics' Institute Fair, Mr. Dall inquired of us with a good deal of interest about the Paris Exposition—"whether it had taken place," and "whether it had not proved a kind of failure," as it was thought it would do when he left the confines of telegraph and newspaperdom.

Next week we will furnish our readers with a more detailed account of the country explored by Mr. Dall. We may add here that he has procured fossils enough to determine the geological age of the country visited, and upwards of 1,000 zoölogieal specimens.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week Ending September 9th, 1868.

81,894.—Improvement in Explosive Compounds.—Joseph Hafenegger, San Francisco, Cal.:

I claim the within described explosive compounds consisting of Nos. 1, 2, 3, 4, 5, made of the ingredients enumerated, mixed or compounded in about the proportions specified. I also claim the self-igniting match, compounded of the liquids or fluids enumerated, whether applied separately or mixed to the explosive compounds or materials sought to be ignited or exploded, substantially as described.

This patent was noticed at length in our issue of Sept. 12th, 1868.

81,910.—Improvement in Escapements.—Wm. C. Kellum, San Francisco, Cal.:

1. I claim the detent F, and the adjusting screw d, together with the curved arm H, and the spring I, operating by the liberating pin a, or its equivalents locking by spring or gravitation, substantially as and for the purpose described.

2. The escape wheel B, moving in a plane parallel to that of the balance staff and of the plates A, A, and giving impulse to the pallet c, either from the sides or point of the teeth, in combination with the detent F, arm H, and spring I, substantially as described.

3. The balance staff c, standing parallel with the plate A, and the liberating pin a, passing alternately above and below the lip J, at each vibration, substantially as described.

We shall mention this patent next week.

81,992.—Improved Dye Stuff.—C. E. Fox and Mary E. Fox, Gilroy, Cal.:

What we claim as our invention and desire to secure by letters patent is the extract (or coloring matter) of manzanita as a new article of manufacture for its various uses as herein specified.

REISSUES.

3,114.—Improvement in Gang Plow.—Don Carlos Matteson, Stockton, Cal.:

I claim the arrangement as described of the false beam N, goose neck G, axle *n*, lever *i*, catch L, and the system of plows attached to their frame as set forth, the whole being constructed and operating substantially as and for the purposes specified.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, September 26, 1868.

City Stocks.

In miscellaneous stocks there has been little doing during the past week, and Board transactions were limited to a few companies. Sales of Spring Valley Water Company stock were effected at $66 25, and National Insurance Company at $72 per share. At the close, North Beach and Mission Railroad stock sold at $67 50, and Spring Valley Water at $66@66 25.

The annual meeting of the stockholders of the Bank of California will be held at the banking house in this city on Tuesday, October 6th, at 11 o'clock, for the election of a Board of Trustees for the ensuing year, and the transaction of other business.

The receipts of the local insurance companies during the month of August and previously this year, according to the returns in the hands of the Internal Revenue Collector of this district, have been as follows:

	August.	Previously this year.	Total.
Pacific	$35,914	$444,525	$540,439
Union	41,484	234,614	276,098
National	.....	201,253	201,253
Fireman's Fund	20,414	132,142	152,556
Builders'	19,125	142,452	161,577
California	7,550	87,057	94,587
Merchants' Mutual Marino	25,181	121,457	146,638
Occidental	12,523	52,909	65,432
Home Mutual	12,857	73,987	86,844
San Francisco	.....	25,974	25,974
Peoples'	6,298	45,514	51,812
Totals	$241,436	$1,561,754	$1,803,190
Same time in 1867	248,696	1,246,366	1,494,972
Increase in 1868	.....	$315,388	$308,218
Decrease in 1868	$7,170	.....	.....

The returns were made upon a legal tender basis, the rate—72 cents for January, 71 cents for February, 72 cents for March, April, May and June, and 70 cents for July and August—being fixed every month by the Assessor of the district.

The National and San Francisco have disincorporated and their outstanding risks have been transferred to the London and Liverpool and Globe Insurance Company.

The above statement shows an increase of $21,640 as against the receipts in July. The receipts of the several companies in August, as compared with July, show the following difference:

	Increase.	Decrease.
Pacific	$20,346	.....
Union	5,084	.....
Fireman's Fund	1,857	.....
Builders'	.....	$2,251
California	.....	3,457
Merchants' Mutual Marino	1,471	.....
Occidental	229	.....
Home Mutual	.....	557
People's	.....	782

The receipts of the city railroads for the month of August and previously this year, have been as follows:

	August.	Previously this year.	Total.
Omnibus	$21,906	$175,745	$203,651
North Beach & Mission	26,624	154,234	180,808
Central	17,323	96,256	113,579
Front Street, Mission & Ocean	9,844	57,751	67,595
Market Street	11,998	60,838	72,836
Potrero and Bay View	2,950	13,369	16,319
Totals	$86,645	$558,192	$654,838
Same time in 1867	75,643	453,729	529,372
Increase in 1868	$21,002	$104,461	$125,466

Showing an aggregate increase of $4,227 in August over the receipts of July. The receipts of August as against July show the following difference:

	Increase.	Decrease.
Omnibus	.....	$920
North Beach and Mission	$1,960	.....
Central	1,857	.....
Front Street, Mission and Ocean	527	.....
Market Street	654	.....
Potrero and Bay View	147	.....

The receipts of the San Francisco and San José Railroad were $50,823 in May; $51,425 in June; $52,502 in July, and $52,663 in August. The Mission Bridge Co. report receipts for August to be $1,201.

Mining Share Market.

The mining share market exhibited more vitality during the past week, and increased confidence is manifested in some of the more prominent claims on the Comstock lode. The aggregate transactions have also been larger, and a general improvement in prices was noticeable up to the 23d instant, after which a slight recession took place. At the close, the market is somewhat more buoyant.

Yellow Jacket—has been somewhat more active at better prices, rising from $1,145 to $1,270, receding to $1,235, and closing at $1,275. After many efforts we are at last enabled to publish the following annual report of this company for the year ending June 30, 1868:

RECEIPTS.

Balance at credit of Company last Annual Report		$116,086 54
Assessment No. 9—Oct. 12, 1867	120,000 00	
Assessment No. 10—Nov. 15, 1867	120,000 00	
Assessment No. 11—Jan. 22, 1868	150,000 00	
Bullion—34,118½ tons of ore, average yield per ton, $19 50	676,861 39	
Ores sold	5,112 51	
Profits of Morgan Mill for the year	40,821 78	
Hoisting ore for Kentuck Company	10,896 00	
Cash received over expenses of advertising assessments	776 02	
		$1,240,585 34

DISBURSEMENTS.

Dividend No. 13		$ 90,000 00
Labor at Mine	294,833 62	
Reduction—Outside Mills	254,228 16	
Company Mill	263,415 42	
Legal Expenses	14,848 88	
Wood for Mine	45,421 72	
Timber and Lagging	62,070 10	
Improvements at South Hoisting Works	45,368 26	
Assay Fees, Discount and Federal Tax on Bullion	21,801 51	
Salaries of Officers	20,303 33	
Mine Supplies, Candles, Oil, Iron, etc.	38,717 08	
General Expenses	29,142 36	
Sundries	11,176 37	
Balance at credit of Company over all Liabilities	49,249 13	
		$1,240,585 34

The following balance sheet is submitted by the Company for the fiscal year ending June 30, 1868:

LIABILITIES.

Bills Payable	$38,671 86	
Dividends uncalled for	2,575 00	
Balance due Mills	23,179 12	
Sundry accounts	2,396 01	
		$66,821 99
Balance at credit of Company	49,249 13	
		$116,071 12

ASSETS.

Cash in Bank of California	$104,724 17	
Sundry accounts	7,314 80	
Morgan Mill Supplies	2,304 18	
Mine Supplies	302 97	
Assessment on one foot unissued stock	825 00	
		$116,071 12

Imperial—sold to a moderate extent at improved prices, advancing from $93 to $99, and closing at $100. The receipts of bullion to date for September account foot up $25,325. The main shaft is now 78 feet in depth below the 900 level. The drift on the 900 level is 340 feet from the shaft, having about forty feet to run to get under the body of ore now being worked on the 700 level of the Alta mine. The raise from the 900 level is up 120 feet, and the winze from the 700 level of the Alta mine is down 110 feet, leaving 50 feet yet to run to make the connection between the old and new shafts. They are now opening a body of ore eight feet thick at a point 25 feet below the 150 level of the Alta mine, west and south of shaft, assays of which show from $25 to $40 to the ton.

Amador—was in the market at $240. The receipts of bullion for the first half of the present month amounted to $24,400.

We herewith give some general information regarding this mine, which we deem of great interest, since our California quartz mining companies are steadily gaining in public favor. "The mine was located in 1850, and staked out 1,850 feet on the ledge. In 1858 it was bought by Alvluza Hayward, and in October, 1867, it was put on the stock market. There are two working shafts on this claim—the Eureka and Badger—the first being over 1100 feet in depth on the ledge, and the other, distant 376 feet from the first, has been connected with the latter in the lower drift. From a careful estimate, made by Mr. Bowie, mining engineer, some six months ago, the ore in sight was valued at nearly $1,800,000, the vein ranging between three and eighteen feet in thickness, and yielding from $12 to $20 per ton. Deducting 30 per cent. for working, etc., there remains about $1,250,000 net profit. The average cost of working a ton of ore, during the month of January last, was $5 76; for the entire year, however, the average is higher. During the thirteen months ending with January, 1868, there were extracted and milled 26,714 tons, giving a gross yield of $536,000, equal to $20 per ton. The milling cost of the above amount of ore was $6 04 per ton. We give the following estimated reexpitulation, made early this year:

Net value of Reserves, deducting 25 per cent. for over estimates, etc	$847,653
Average width of vein at lowest level, north of shaft	15 feet.
Average width of vein at lowest level, south of shaft	9 foot
Average yield of quartz per ton	$20 03
Cost of mining and milling, per ton	$6 04
Profit per ton	$13 99
Monthly crushing capacity	1,800 tons
Monthly product	$36,000
Monthly expenses	$10,800
Monthly profit	$25,200
Profit per annum	$302,400

The net profits for the whole year of 1867 averaged $29,111 per month. The quantity of rock milled during this period averaged over 2,000 tons monthly, while the above estimate is based upon the crushing of only 1,800 tons monthly of north shaft rock, excluding the rich Badger rock, and must therefore be considered as a minimum estimate."

Since the above reports were made public, the Badger shaft has been carried to a further depth of about 180 feet, passing through very rich ore at the lowest level. Where the connection has been made with the lower level of the Eureka drift, they have drifted upwards of twelve feet south from the shaft, and also sunk the shaft some twelve feet, finding the same good class of ore in both directions.

Kentuck—declined from $295 to $273, rose to $298, and closed at $300. The receipts of bullion to date for the present month aggregate $67,952, being a slight excess over receipts same time in August.....Crown Point sold within a range of $41 50@46, then at $42 75, and closed at $45. The shaft is now 92 feet in depth below the 900 level. It is believed that the Rhode Island mill can be kept fully employed until they can raise up to the ore between the 800 and 900 levels and open out the stopes. Nothing new at latest dates as regards a more favorable condition of the mine.

Hale & Norcross—improved from $46 50 to $50 50, and at the close sold at $49. The cross-drifts east, both north and south, do not show any ore yet, and in the main drift west they have some streaks of quartz, and have cut through a small clay seam, but as yet have no ore. They are now running to connect the bottom of winze from the fifth level of the Savage mine with their north "raise." When this connection is made they will prospect thoroughly, in order to ascertain if the ore found on the fifth level of the Savage continues to that depth.

Chollar-Potosi—advanced from $138 to $153, declined to $143, and closed at $146 50. During the week ending September 18th, 849 tons of ore were extracted. The Blue Wing stope does not look as well as at last report. The body of ore mentioned last week as having been developed in the north end runs up to within ten feet of the surface. Nothing of importance from the new works.

Alpha—sold at $36@48, and closed at $45. On the 630 level, 35 feet from east clay, they are opening a fine looking seam of ore about fourteen inches wide. It is believed that it will not prove to be as base as the previously discovered body....Belcher will hold a special meeting on October 1st, to incorporate under the laws of this State....Exchequer annual meeting takes place on the 19th of October....Julia annual meeting, October 12th.

The Grand Excursion.—Mr. E. Hoppel Hall, who left here in February, 1867, overland for New York, arrived from China by the Great Republic on Saturday last, having completed his tour around the world. He has prepared the material for a "Guide Book Around the World," which is soon to be published in New York.

A Singular Fact.—A young man lived to be twenty years of age before discovering that he was near-sighted. A pair of Muller's spectacles, 205 Montgomery street, opened up to him at once a new world of beauty. *

The Mechanics' Institute Grand Carnival has been postponed till Tuesday next, September 29th.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

San Francisco, Sept. 25, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.			Per ton.
12 per cent. ore	$16 00	22 per cent. ore		$43 56
13 " "	18 62	23 " "		46 45
14 " "	20 20	24 " "		49 33
15 " "	23 35	25 " "		52 22
16 " "	26 26	26 " "		55 11
17 " "	29 12	27 " "		58 00
18 " "	29 91	28 " "		60 80
19 " "	34 00	29 " "		63 77
20 " "	37 78	30 " "		66 66
21 " "	40 67	31 " "		69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Knit Goods.—The Pacific Woolen Mills commenced operations less than two years ago, with a capacity of turning out 100 dozen stockings and sixty-two dozen shirts and drawers daily. These goods are all of a superior quality, heavy, strong, remarkably well finished, and furnished to the trade lower than the same quality from the East. Lazard Frères, Battery street, are agents for their sale. *

Not at Home.—The whales of the Ochotsk Sea have gone to other localities this summer, according to the northwest whalers recently arriving here, who report dull times in hyperborean waters since the Russian bear has retired beyond the horizon. It is reported from the East that the fleet which resorts to Hudson Bay and adjacent waters has done better this season than usual.

Amusements.—"He that has no music in his soul is fit for treason, stratagems and spoils." Remember the grand instrumental concert at Woodward's Gardens every Sunday afternoon. * *

Electrotype Cuts, Engravings, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this line.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Sept. 12th: The machinery for the Morning Star works is arriving to-day.

The Trustees of the Rippon Co. are highly pleased with the late strike in their mine, and intend to make arrangements for a more thorough working of it.

Chronicle, Sept. 12th: The face of the Rippon tuunel of this claim is solid quartz. The ledge has been penetrated ten ft. and steadily improves, and the rock is believed to he rich.

Amador County.

Jackson *Ledger*, Sept. 19th: Mr. R. Palmer, agent for the Anaconda mine, located at Pine Grove, is in town, making arrangements for eommencing work on it. He has been examining the hoisting works of the Butte Basin Mining Co. with a view of purchasing them.

We learn that John A. Fall, Esq., has taken possession of the old Amador mine, and will at once put machinery on it, and sink the shaft to a depth of 300 ft. This mine is located the first north of the Spring Hill, at Amador City, and is believed to be good.

Dispatch, Sept. 19th; The proprietors of the Casco minc are erecting a 20-stamp mill on their lead to he run by water power, which will be completed and in running order within 60 days.

The Seaton mill, near Drytown, was totally destroyed by fire last Saturday.

Sept. 12th: A prolonged "whistle" from the engine of the new Kennedy quartz mill, warned our citizens of the readiness of that institution to commence crushing rock.

Inyo County.

The Cerro Gordo correspondent of the Aurora *Union* of Sept. 12th, says: Mr. Desormaux and Baudry's furnace is working finely, we may venture to say that it is a perfect success. They have extracted bars of lead containing a larger percentage of silver, than was ever extracted from any veins of argentiferous galena in the United States or Spanish America. Competent assayers estimate the ton of lead hars at $780 in silver, $35 in gold, and the value of lead at the ruling market price at $120 per ton. Deduct 48 pounds for the silver and gold eontained in the ton, and you will have 1,952 pounds of lead, worth six cents; $117.12 per ton, thus showing that one ton of lead bars from Cerro Gordo is worth: silver $780, gold $35, lead $117.12—total $932.12. The furnace has smelted in 30 hours 104 bars, weighing four tous and 300 pounds, or a total value of $3,864.12 All the mines upon which work has been done to the depth of 15 ft have proven thus far good, and beyond everybody's expectation. Prominent among the best mines in the district are the St. Ignatius, St. Lucas, and Belmont. The ore from the first is sold at the dump for $125; the second $114; the third from $120 to $200 per ton.

Although everything looks lovely, I would not advise miners or men that are making a good living to eome here, for wages are only $3.50 per day, and hard to get work, and provisions at enormous prices.

Nevada County.

Transcript, Sept. 16th: The Branch Mint ledge is located on the southerly slope of the same ridge with the Banner and Pittsburg mines. The lead is two feet wide and can be worked 275 ft. below the surface, and thc tunnel may be run for the whole distauce along the ledge.

John McNamar & Co. have located Grant and Union ravines, Bridgeport township, for mining and ditch purposes. Their claims are located on the east side of the main Yuba, below the junction of the North and Middle Forks, and extending along the ravines half a mile.

Sept. 22d: The Star Co. at North Sau Juan, eleaned up $10,000 after the last ruu. This is the only company at work on San Juan Hill.

The Amerieau Co. of Sebastopol, Bridgeport township, have purchased the Gold Run claims.

Gazette, Sept. 17th: A gentleman who visited Quaker Hill a day or two ago, informs us that Geo. Jaeobs is now putting up flumes and other fixtnres for working the Railroad diggings. The work done last year proved the claims to be rich, and the intention is to commenee hydraulicing as soon as water can be obtained. The eañon below the Railroad claims is held by Bullard and Furt, who eleaned it up recently and obtained therefrom, over all expenses, $584. The cañon is cleaned once a year, after the work is suspended in claims above, and the owners are at little other expense than cleauing up.

Sept. 19th: The Superintendent of the Sneath & Clay mine has published a request for proposals to sink the main incline on this mine 100 ft. below its present depth, also to run several levels and repair the drain tunuel.

Sept. 22d: Wm. M. Eddy started up his 15-stamp cement mill at French Corral, yesterday morning.

The large water wheel of the old Forest Springs quartz mill broke down on last Saturday and work was suspended.

Grass Valley *National*, Sept. 15th: The Hope Gravel Co. on Alta Hill, made their first shipment of gold yesterday. Supt. Locke says that he is taking out gravel that is very rich.

Sept. 16th: The Gold Hill mill is kept constantly employed. Some excelleut rock from the Shanghai, on Massachusetts Hill, is now being erushed. The Shanghai rock has never failed to yield profitable returns.

At the Grass Valley Fouudry an immense 5-stamp battery, weighing nearly 5,000 ℔s. has just been turned out for the Empire Co., while work for the Rising Sun, North Star and other companies is also being done. At the Mill Street Fonndry a bed plate weighing 6,000 ℔s. for the North Star Co. has just been completed; also a 16-inch plunger pump, weighing 20,000 ℔s., besides 500 ft. of 16-ineh pipe.

A gentleman of great experience in quartz mining, writing from Silver City, to his family in this place, gives a very glowing account of the richness of the ledges in that locality. He says he witnessed a clean up made in one of the 10-stamp mills, after a run of six days, and the enormous quantity of 1,200 pounds of amalgam was realized.

The Truckee *Tribune*, formerly the Dutch Flat *Enquirer* of Placer county, now published at Truckee in this county, says: The claim of Kinder & White, situated near Lowel Hill, in this county, put off a blast of 125 kegs of powder, last week, which did good work in the way of loosening the ground in its vicinity.

Excelsior.—Truckee *Tribune*, Sept. 19th: The Mohawk & Montreal Co. have been running their mill on an extensive body of ore lately discovered in a new drift, and enough has been cleaned up to warrant the belief that the yield of the erushing will be nearly $15,000. Enough ore equally as rich as that reduced in the present instance is said to be in sight to keep the mill running for months to eome. The Empire Co. erushed a number of tons of rock a short time since that yielded a fraction over $21 per ton in free gold, and the company are now engaged in roasting their sulphurets preparatory to working them in paus. The Enterprise Co. worked some of their third grade ore and it returned nearly $22 per ton. The Green Emigrant Co. have gotten out 100 tons of ore which they will have worked at the California mill as soon as they can get it hauled.

Sierra County.

Downieville *Messenger*, Sept. 19th: The company working the Alaska mine is meeting with unbounded suecess. The excellent character of the rock is shown by the result of a short run on quartz taken from the drift, upwards of $6,000 being realized by simple battery amalgamntion, with five stamps. Yesterday the Alaska Co. opened their battery after a run of 96 hours, and took out over $3,000.

Siskiyou County.

Yreka *Union*, Sept, 19th: Mr. Fabricius Jones, of Little Humbug, showed us a slug, one day this week, taken from his elaim, which weighed about four ozs. It was a beautiful flat piece, about two inches long and 1½ inches wide.

Tulare County.

Visalia *Delta*, Sept. 16th: The White River Mining Co's mill is now run day and night with good results, the rock paying $100 per ton. Maltby & Biggs have a fine ledge in their 100-ft. level on the Eclipse miue, varying in width from 18 inches to two feet, and will pay from $100 to $300. I saw rock from this mine which yielded as high as $16 to the pound. The Philadelphia Co. are at a stand still, as usual, nevertheless they have a fine mill and good mines.

Yuba County.

Marysville *Appeal*, Sept. 16th: In their level 10, incline No. 1 the rich pay chimney in the Pennsylvania mine at Brown's Valley cannot be reached short of a week or two. For incline No. 2, after a few weeks careful prospecting the eompany flatter themselves of having finally found out how to reaeh again their rich soapstone ledge; from the bottom of this shaft, 380 ft. deep, they are now running a new level in a northerly direction, hoping to reach this rich chimney in less than 30 ft. from the incline. The Rattlesnake is hoisting rich quartz from their lowest level, and their ledge is already over two feet in thickness; they intend starting their stamps again next week. The Jefferson is still making a little over expenses. It is rumored that their ledge is greatly improving in their lowest northern level as well as at the bottom of their shaft. Our millmen complain much about the great scarcity of good hands accustomed to blasting underground; none however but those of steady good habits need apply.

ARIZONA.

Prescott *Miner*, Sept. 5th: Mr. Borger was to have left San Francisco, for Prescott, on the steamer of the 22d of last month. As soon as he arrives, work will commence on the Sterling. He has shipped a supply of chemicals, and other necessary articles for working the ore by chlorination.

We had a call from Mr. Solomon Shoupe, of the Excelsior Hydraulic Mining Co., Lower Lynx Creek, Sunday last. He informed us that the claim paid first-rate, the previous week, three men having taken out nearly $300.

Work is going on in Walker's, Big Bug, and Hassayampa mining districts.

At Wickenburg, the mills are turning out plenty of gold, and preparations were being made for the erection of a new 20-stamp mill. The new pans recently set up in the Vulture Mining Co's 20-stamp mill, were working sulphurets with good satisfaction. The Vulture was yielding plenty of first-class ore.

In Yuma, Mohave, and Pima counties, the miners are busy at work, and a prosperous season is anticipated.

ALASKA.

The Portland *Oregonian* of Sept. 12th, gives us the following from our Arctic possessious: At Wrangle, the soldiers have discovered a mine which is thought to be silver. Specimens of the rock have been sent below for assay....At Sitka, coal of about ordinary quality has been discovered.... Mr. Lord thinks that there are undoubtedly good gold mines in the Stickeen river country. No prospecting to amount to anything has ever been done.

COLORADO.

Georgetown *Miner*, Sept. 3d: Huepoden, Wolters & Co. have shipped since our last issue, 2,003 ozs. of silver bullion, coin value, $2,138.14. Their water wheel broke down on Tuesday night, and will require three or four days' time to repair it.

A. M. Cassidy and Dr. Kane, of Pittsburg, Pa., have leased that portion of the Henry Ward Beecher lode owned by the Bohemian Mining Co., and their furnace, for a term of years. Work has been eommenced on the mine, and the furnacc is to be rebuilt on a larger scale. They will reduce their ore to lead riches, which will be shipped east for desilverizing.

Denver *News*, Sept. 9th: We recently saw a specimen of ore that was sent to the mint for assay, which upon being struck with a hammer to break it, revealed several very neatly drilled holes that were hiddeu before. They were about one-eighth of an inch in diameter, and may have been worm holes, but Dr. Munson concluded they might have contained the gold he was expected to certify to. Fearing this was lost, he did not make the assay.

The editor writing from Breckenridge, Summit Co., says: In Corkscrew Gulch two eompanies are at work. Pierce & Hopkins are working three men, and taking out fair pay. Their flume is 350 feet long, and when through the rim rock, now in the way, they expect to take out not less than half an ounce per day to the man. J. Hilderbrand is working two men, and is taking out about $5 per day to the man. For the balance of the season he expects $8 a day to the man.

On the Blue, Thomas Klak is working alone, and is taking out from $6 to $7 per day.

Two companies are working in Negro Gulch. Geo. Lupton has two flumes with a eombined length of 300 ft., and two hydraulics, and is now working seven men. He is taking out half an ounce per day to the man. Morris & Coatney, in the same guleh, are working 14 men, and have a flume 500 feet long. Their claim is paying about $11 per day to the man.

Soda Gulch is being opened by Pollock, Marksbury & Wilkie, who are employing four men. They have one hydraulic, and a flume of 300 ft.

In American Gulch, Carter & Paige are working four men, and have one hydraulic, and a flume of 400 ft. Their elaims are among the best in the county, and are paying one ounce per day to the man. In the same gulch Hitchcock & Co. are taking out $10 per day to the man.

Humbug Gulch is being worked by Mr. Overson, who is taking out from two to two and a half ounces per week.

In Georgia Gulch, Robt. Boylan is working four men, and is taking $16 per day to the man. Robinson & Rohley are working three men. Their first and only clean up this season averaged them $8 per day to the man.

Galena Gulch is being worked by the Galena Gulch Mining Co. The mine is yielding about three-fourths of an ounce per day to the man.

A company employing six men are opening Salt Lick Gulch, whieh has not begun to pay. They are also working a small tributary gulch whieh is paying from $3 to $5 per day to the man.

Stillson's Patch is still being worked and is yielding largely. McFadden & Madden are taking out from $12 to $15 per day to the man. One clean up was as follows: Thirty days' work gave 20 ozs., and auother of ten day's work gave seven ozs. Their claim has yielded this season something over $4,000. Mower & Co. are working four men, and taking out an average of $10 per day to the man. John Sisler is opening a claim with one hydraulic and a flume of 250 feet.

IDAHO.

Owyhee *Avalanche*, Sept. 12th: We challenge, not only the Territory and Pacific Coast, but also the entire mining world to produce a superior or even an equal, to a clean up made this week at the Lincoln mill, from Ida Elmore ore. Bring forward your figures; we claim the palm for Owyhee. McDonald & Co. assayed the bullion and molded it into bricks, the total weight of which was 8,351¼ ounces, valued at $78,187. One of the bricks weighed 1,965¼ ounces, worth $22,177.32, and without fear of impeachment we say it is the most valuable single brick ever produced by a quartz mine. Taking for granted that the aforementioned can't be beat, we'll just mention another that we saw in the lot, weighing 1,825 ounces, and valued at $20,671.41. And if the latter is too large, in the same lot we fiud a third of 1,642½ ounces, valued at $18,389.67.

This week a large and rich quartz vein was discovered in the gulch south of the Pauper mine. Haight, Gheer and Cogswell are the finders. We visited the discovery on Wednesday, and found the quartz to be fully five feet in width, with regular and well-defined casings. A considerable portion of the quartz is decomposed and contains large quantities of both gold and silver. We were shown about a dollar in gold and a fine showing of silver, obtained from one pan of the decomposed quartz.

River bed mining at Deadwood is a failure, the gold product being far below expectations. Hill, bar and gulch claims still hold out and will be good for many years.

MONTANA.

Helena *Post*, Sept. 11th: Day before yesterday, Messrs. F. Bohm & Co., assayed 1,200 ounces of gold. worth $23,000 in gold coin.

From four pounds of rock from the Park lode, Jim Whitlatch, in about 15 minutes yesterday, turned out $65, in a mortar and pestle hand stamp mill.

There last night arrived at the First National Bank, 374 ℔s. of silver bullion from Phillipsburg. It was extracted from the ores of the Hope lode by the mill of the St. Louis and Montana Mining Co.

On Saturday afternoon at 4 o'clock, Bohm & Co. commenced smelting a lot of dust, and at 8 o'clock of the same evening, had over 1,100 ozs. of gold, worth $20,840 in coin, manufactured into bricks.

Day before yesterday, at the First National Bank Assay office, Prof. Steitz assayed 5,607 ozs. of gold and silver hullion, the coin value of which was $31,698.74. Included in this lot was one brick of 700 ozs., worth $13.143.79.

Wm. Nowlan arrived from Cable on Saturday, bringing with him what at first seemed to be a large loaf of Boston brown bread, well done and just the thing to eat with baked beans. A eloser inspection showed it to be a large mass of splendid gold retort, weighing over 600 ozs., worth over $11,000, and the result of two weeks' run upon the Cahle lode in the Wm. Nowlan mill.

The new diseovery at Cœur d'Alene which eaused the reeent exeitement and stampede among our miners, are pronounced by persons who have thoroughly prospected them, one of the greatest "hilks" of the season, not even a color heing found to justify the report.

Capt. Maltby, at Sterling, is now running Prof. Eaton's mill on ore from the Red Bluff and Galena lodes, with satisfactory results. On the 25th ult, the 10-stamp water mill of Hall and Spaulding, on Meadow Creek,

started up, and is now running with much better results than its proprietors anticipated.

In Humbug Gulch, near Highland, three arastras are in operation. The lower one is worked by Nevins Bros. & Co., on the Nevins' lead, the second and third by Flowers, Stephenson & Co., on the Only Chance lead. The second arastra runs night and day, and is cleaning up about $1,300 per week, the quartz crushed averaging $75 per ton. All the tailings are saved and will be run through the mill when it is completed. At the third, or upper arastra, the weekly clean up ranges from 40 to 90 ozs. The Only Chance lode, owned by Messrs. Flowers, Stephenson & Co., consists of decomposed quartz, mixed with clay and sand, and is from six to ten feet in width. A tunnel 350 ft. in length has been run upon it, and the miners are now following the lead up towards the surface. The Nevins lode has a shaft on it between 100 and 125 ft. in depth. Its quartz is of a rusty character and much harder than that of the Only Chance mine.

Thomas, Head & McGregor cleaned up from the claim in Confederate Gulch last week the sum of $12,000. Their expenses for the same time were only $2,000. On Wednesday last parties engaged in repairing the old drain ditch, which had caved in, tapped the main body of water which had "backed up," so that it was lowered five feet in fifteen minutes. All the claims just above Diamond are now in a condition to be worked.

In Cooley's dry gulch, De Lorimer & Co. are working a hydraulic claim night and day, and employ 20 men. They obtain an abundance of water from Mammoth Gulch. Their claim is one of the richest in Highland, paying from $15 to $20 per day to the man. Hurlburt & Co's claim adjoining that of De Lorimer & Co., is being worked by means of drifting, and pays, on an average, $25 a day to the hand. In Highland Gulch, O. A. Langworthy's bar claim pays on an average, $15 per day to the hand; Dougherty & Trainer's pays from $10 to $12 per day to the hand. Mansfield's Gulch claim pays $14 per day to the hand, and the other claims are doing nearly as well.

Great activity prevails at present at Unionville. The daily yield of the Whitlatch & Sensenderfer, Hodge, Ricker & Turnley mills is not less than $300.

The Whitlatch Park Co. is vigorously prosecuting work upon discovery and No. 3 west on the Park lode, and Clark & Hale are mining energetically on No. 2 west on the same ledge, and both parties are obtaining some of the best rock ever seen in the Territory. Mr. Whitlatch is striking it rich on No. 2 west on the Owyhee. Maj. Addis' mill is to start up in a few days.

The Virginia *Democrat* says that the Green Campbell and Everett mill is progressing finely at Silver Star, and will be in running order by the 1st of October.

NEVADA.

Humboldt.

Winnemucca *Argent*, Sept. 17th: J. M. White brought down from the Golconda mine, 1,148 ozs. of bullion on last Saturday, which was shipped below by Wells, Fargo & Co. The mill has capacity enough to turn out a weekly average of double that amount, but there is too little water, and that is diminishing.

Home Ticket specimens were laid on our table this week by Wm. Hurst. This claim is considered the equal of the Golconda—of which it is probably a continuation. The specimens before us are about 75 per cent. mineral, and ore of the same character is abundant.

The rock in the Union Series tunnel has been very hard of late, but a softer body has been reached, and the work is advancing faster. Considerable water is coming in, which may be from the vein, which ought to be reached at no great distance farther.

Work will be resumed shortly on the mine and mill of the Sheba Co.

Unionville *Register*, Sept. 19th: The smelting works at Oreana are now doing most excellent work, and in the course of a few days more, furnaces that are now being re-lined will be started up.

Fall & Co. shipped this week, per Wells, Fargo & Co's express, 2,000 ozs. of fine bullion.

Reese River.

Austin *Reveille*, Sept. 12th: Speaking of the mines at White Pine, this paper says: Several of the claims are as productive as gold placers. Two men who had been in the district for a couple of weeks without discovering anything, were on the point of leaving it when they were offered a claim to work on shares—the owner to receive one-fourth of the net proceeds of the ore extracted from it. Without much hope of success—for the claim was undeveloped—the men went to work, but for several days they found only occasional pieces of chloride ore in the limestone debris. At last they struck a streak of rich ore a few feet below the surface, which they extracted and carefully assorted. Seven tons of this were brought into this city to the Manhattan mill for reduction, the assays of the pulp of which yielded at the rate of $2,735.89 per ton. Besides this lot they have a small quantity of extra fine ore, which they have reserved for smelting.

Sept. 16th: A very rich discovery has been made on Lander Hill, in the neighborhood of the Isabella mine. The ore is said to be sulphuret, in which the beautiful ruby is abundant, and a considerable number of tons which have been produced, are estimated to yield at the high rate of $500 per ton.

The first lot of bullion which was produced at the Old Dominion mill, at Hot Creek, since it was rebuilt, arrived in town yesterday afternoon, and amounted to some 2,000 ounces.

Sept. 17th: Capitalists in Indiana have telegraphed to the former Supt. of the Centenary Co. of Newark, to purchase certain mines in White Pine district, and to make preparations for building a 20-stamp mill in the Spring.

Sept. 18th: One wagon load of machinery for the mill which is to be erected by Jeremiah Miller, in the district of White Pine, passed through this city this afternoon.

Virginia *Enterprise*, Sept. 11th: Some of the mines of White Pine are yielding ores of almost fabulous richness. Parties from that section say it is by no means uncommon to see large lumps of ore that are so near pure silver, that by placing a half dollar on them and striking it a blow with a hammer, a perfect impression of the coin is left in the metal. These lumps the miners find no difficulty of disposing of in the crude state for coin. A gentleman from Austin informs us that he saw one lump of ore of the kind mentioned, weighing 40 or 50 pounds, sold by a miner, at the banking house of Paxton & Thornburg, for $300. These rich ores (horn silver) are often found in the very top of the lead and many times projecting a foot or two above the soil. A gentlemen who spent some weeks in the district, gives us the following account of its geological characteristics and the facilities for mining. The hill in which these rich ores are found is about three miles long by a mile in width, and is upon the surface of a limestone formation. This limestone is a complete mass of fossil shells, and the deposit is some 400 feet in depth. It rests upon slate, as is seen in places where deep ravines have cut through it. The country rock in the regions surrounding this mountain is principally granite, and the leads found in it contain such a large per cent. of base metals that they are not of much value. Nearly every lead yet found in the limestone range has contained ore of the kind we have mentioned above. Some of the principal leads were at first supposed to run east and west, those who found them being led to that conclusion from the position of the masses of ore found upon and near the surface; but they have now attained a sufficient depth on one or two of the leading mines to ascertain that they run north and south, or nearly so—the masses of ore that appeared to lie in an east or west direction like the croppings of a lead, proving to be but the overflow from the veins, the regular walls being found running north and south. Often the leads are capped over by limestone, and the prospector has only upon the surface a streak of spar to guide him in his search for the coveted mineral deposit. Our informant says that in one place he saw a company of miners blasting away the limestone and following down a streak of spar but two or three inches in width. They had found rich float ore in the ravine below, and were confident that it had been spewed up from a vein at the point where the seam of spar appeared, the rock having formed over the lead. They were further encouraged in this belief by the finding of good prospects in silver in the spar and adjoining limestone. A day or two after he visited the spot and found that they had reached their lead, and a blast which they had just exploded in it had thrown out one mass of ore of about 400 pounds weight, which was estimated to contain $1,000 in silver.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Sept. 16th: The lower level of the Yellow Jacket mine continues to yield rich ores.

Sept. 19th: Wells, Fargo & Co. and Pacific Union Express, shipped from this city and Gold Hill during the past week, 8,073 pounds of assayed bullion, worth $24,887.20.

The Pacific Mill, Lower Gold Hill, which was stopped for repairs, is again running.

Trench's mill, Silver City, will resume operations to-day. The mill has lately been undergoing repairs to its machinery.

Sept. 20th: The Empire and Bacon Cos. are engaged in setting up a blower at the old Imperial hoisting works, for the purpose of working from the 500-foot levels of their mines.

The Imperial Co. have a large number of men employed at present, and are raising a great amount of paying ore, with the intention of getting a supply above ground for winter use.

The Alpha Mining Co., Gold Hill, are at present taking out some excellent ore and have a large body of the same in their mine, between the 200 and 300-foot levels.

OREGON.

Portland *Oregonian*, Sept. 10th: A lot of quartz rock from the Bohemia mines has been shipped from the Umpqua river to San Francisco, to be subjected to test.

The Eugene City paper says: A miner working a claim about 30 miles from Baker City, a few days ago, picked up a nugget of gold worth $1,500.

J. B. Underwood has shown us a gold brick from Bohemia quartz which he had assayed in Portland a few days ago. It weighs $15.25, and is from 400 lbs. of rock, making a yield of $79.25 to the ton. This rock was of an average quality and no gold was visible in it.

The ledges now being worked in the Bohemia mining district are the Excelsior, Grey Eagle, Seymour, and the City. The ore is a sulphuret of silver, black or grey in color, mixed with sulphur, iron pyrites, copper, bismuth, arsenic, antimony, zinc and gold. The proportion of gold is the greatest near the surface, and the proportion of silver increases as explorations descend.

Mining in El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from page 178.]

NEAR DIAMOND SPRINGS,

Mr. Ferdinand Gruder has struck a very rich vein of beautiful looking rock, which he is just making commencement upon, and is erecting a 5-stamp mill (water power) and expects to be crushing in a short time. Below this, on the "Mother Lode," towards Amador, some three miles from Mud Springs, is located the Church Union mine, (incorporated) J. B. Church, Superintendent. This mine is composed of two veins, the Union and Cosumnes,—the former, from four to six feet, and the latter from four to twelve feet in width. The lowest levels are on the Cosumnes, 160 feet, and on the Union, 264 feet, and are worked by shaft and drift and steam hoisting works. The rock looks well, some of it showing free gold in abundance. They have a very good 20 stamp mill, constructed by the Vulcan Foundry, and employ, altogether, sixty men; only eight hands, however, are required to supply the mill with rock, the balance are used for developing the mine. Mr. Church is a civil engineer by profession, and is fast learning to become a practical miner. He seems to show the right disposition, and it is to be hoped that he will succeed.

About three miles southwest of the Church-Union, is the Sugar Loaf or Hermitage, owned by a Boston Company, C. S. Maguire, Superintendent. This company will get to crushing again in September, and will then be able to keep the mill (20 stamps) constantly supplied with rock. They are down 200 feet on the vein, which ranges from three to fourteen feet in width. The rock now being taken out looks passably fair for low grade ore, and I should judge that with prudent management, the mine could be made to pay well. Mr. M. seems to be a "rustler," and fully determined to make a winning.

AT NASHVILLE,

on the north fork of the Cosumnes, is the Havilah mine, owned by H. D. Bacon & Co., of San Francisco, Mr. O. Hyde, Superintendent. This has the appearance of being a first class mine. All that is wanting, apparently, is to sink deeper in order to establish its permanency. At present, they are down but 200 feet, where it shows a vein of ribbon-rock from six to eight feet thick. The ore presents a fine appearance, containing considerable sulphurets, and will most unquestionably be made to pay. They have an excellent 40-stamp mill, driven by an engine of 65-horse-power; also a fine furnace for roasting sulphurets for concentration, of which they are erecting two of Paine & Stephen's huddles, each to be eighteen feet in diameter. At present they are not running the mill, but are putting in new iron mortars, invented by the Superintendent, Mr. Hyde; also a crusher; they think they will get to running during September. On the mine they have steam hoisting works, from which the ore is conveyed by cars to the crusher, which is placed immediately over the center of the feeding room. They already have a large quantity of ore taken out, and when the mill starts, it will have no occasion to stop. Mr. B. talks like one who has had an extended experience in quartz, and evidently knows what he is about. His Superintendent, Mr. Hyde, is none of your kid-glove men, but a real worker, a good mechanic, and one who every day is on hand and personally attends to every department. With such men as these at the helm, failure is impossible.

Further down on the same belt, about one and one-half miles below the Havilah, is the Bay State, owned by C. S. Maguire, of the Hermitage, and his company in Boston. This mine has but recently made a start, and are down eighty feet, where they find the ledge well cased, thirteen feet in width, and presenting a quality of ore unsurpassed in appearance anywhere in the county. They are now making their first run at the Enterprise mill, one mile distant, from which they are expecting a very fine yield. Mr. Humphrey Reese has the Superintendency of this mine.

ABOUT PLACERVILLE

there is an extensive range of old channel diggings—deep gravel—which would pay enormously, if an abundance of water could be had at fair rates—say ten cents per inch. As it is, there is but one ditch in the county or district, and that not furnishing over one-tenth the amount required, and selling at twenty-five cents per inch. This ditch company will not reduce their rates, will not enlarge their ditch, or sell to any one that will. The citizens and miners complain loudly that they are thus controlled by one or two individuals. They know they have a large extent of ground that would pay equal to any in the State, had they equal advantages of water. Some few claims are even now doing very well, particularly the Alderson claim. Report has it that some changes will be made soon in the water administration, when mining will again revive in and about Placerville.

At Pleasant Valley, the Monitor Gravel Company are prospecting an old creek channel for a pay streak, and it appears to be only a question of time with them, the indications being very certain.

Near this place is situated the celebrated

PICTURE ROCK QUARRY,

owned by Mr. Fleming, of same place. This is really a novelty in nature, displaying a marvellous beauty of landscape scenery that is wonderful to contemplate. By some, these effects or impressions have been termed photographic, but in the opinion of the writer, the different shades and forms are produced wholly and simply by infiltration—oxide of manganese being the substance. The whole formation, as far as uncovered, appears to be sedimentary, and during the formation of the different strata, it appeared to receive an alternate flow of manganese. Mr. Fleming has a very fine slab, three by four feet, which he will have on exhibition at the State Fair. This will be really worth seeing to the lovers of the beautiful.

[To be continued.]

STONE COAL IN IONE VALLEY.—Just now in the coal mine of James Morgan, in Ione Valley, presents a lively appearance. We learn that twenty tons per day are being taken out and shipped to the Oncida quartz mill, where it is being used very successfully. Two other mines are being opened near this one, and the prospect for an abundance of fuel for our mills is very encouraging. We also learn that Messrs. Coney & Bigelow intend trying this coal in their chloronation works at this place.—*Amador Ledger, Sept. 12th.*

AUSTRALIAN PEARLS.—The pearl fisheries recently discovered in Western Australia extend along the coast for 1,000 miles. It is stated that over sixty tons of pearl oysters were fished up in December last, and sold for $500 per ton in gold.

Notices to Correspondents.

ARTIFICIAL ICE.—Amongst the numerous processes for the manufacture of artificial ice, that of Carré seems to be the best and most economical. The result is accomplished by means of an ammoniacal solution, and by the repeated distillation and condensation of ammoniacal gas, which is used over and over again. Two kinds of apparatus are made by Mignon & Rouart, No. 149 Rue Oberkampf, Paris: a small one for family use, and a larger one for industrial purposes. The smaller one freezes one kilogram of ice in 55 minutes, and costs 282 francs; another size freezes two kilograms in an hour and a half, and costs 406 francs. The industrial apparatus freezes 200 kilograms per hour, and costs 24,000 francs. George Simpson, of No. 315 Oxford street, London, sells a "piston freezing machine," the *glacier roulant* of Toselli, in which nitrate of ammonia and sulphate of soda are used, for from £4 to £11.10. In the Richardson process, hydrocarbon, or other volatile fluids which produce intense cold when volatilized, or distributed in the form of spray or vapor, are used. The principle is invariably the taking away of heat, by the vapors which are formed.

SELF-LEARNER.—What are termed the imponderable bodies, such as heat, electricity, etc., do not become lost, however they may become inappreciable to our senses. When a solid becomes liquid, it unites for a time with a quantity of heat which is perfectly definite; for illustration, a pound of ice in undergoing liquefaction, invariably requires a uniform quantity of heat to produce this effect; the water obtained will appear no warmer than the ice; and the heat, though for a time it ceases to affect the senses, is not lost, but is again given out when the water is again made to revert to ice. The heat so disappearing is termed latent, and sensible as evolved when the water is made to resume the solid form. So far as human understanding can reach, matter, whether ponderable or imponderable is indestructible, but either may assume the most protean forms and complex combinations.

VIOLINCELLO.—For the transmission of sound it is essentially necessary that the vibratory source from which it may emanate should be surrounded by an elastic medium. If a bell is suspended in the receiver of an air-pump, and struck, the sound so occasioned will be distinctly heard while the vessel is full of air; but after commencing to exhaust the receiver at each repetition of the blow, the sound will become fainter and fainter in the proportion of a vacuum being approached, and at last the sound will become so feeble as to be all but inaudible. Other media besides air will transmit sound. A bell, for instance, may be rung under water and will be heard by a person if similarly immersed, at a much greater distance than in the air.

DURING the past week, the Mechanics' Eight-Hour Exchange of this city, supplied 150 mechanics with employment.

The Oregon Iron Smelting Works.

It is gratifying to be able to report progress in so important an enterprise as the smelting of iron on the Pacific Coast. In our second July number we mentioned the receipt of some limonite ore from the Oswego iron mines, located on the Willamette River, nine miles above Portland, Oregon, together with some products from the smelting of the same, which were subsequently exhibited at the Mechanics' Institute Fair. Mr. H. C. Leonard, the Superintendent of the Oregon Iron Works, is at present in this city, and from him we have obtained additional information concerning the extent and character of the works at Oswego, which, we trust, will be found interesting to the readers of the PRESS.

Mr. Leonard, a year ago, visited the best works in the Eastern States, but especially those of Connecticut and New York, and procured designs of the most approved apparatus and machinery for the reduction of iron, which were immediately put into execution by practical experts in that business; and the result is that we have now in operation on this coast a first class smelting stack, on such a basis as to be in a fair way of repaying speedily the capital invested, besides promising to return very handsome profits to the company in the future.

The iron brought to this market around Cape Horn, is chiefly the Scotch Glengarnock pig, which is at present held in New York at $43.50 to $44 a ton, currency. The Oregon iron is very much superior to this, being a charcoal iron, whilst the Glengarnock, being smelted with coke, is only of moderate quality; and the Oregon iron can be furnished in San Francisco at a price as low as the Glengarnock, or for less, if competition should render it necessary. Charcoal iron of the quality produced at Oswego, is now selling in Portland at $44.80 coin (being the company's own price) and in New York at about $65 a ton in currency. In San Francisco, the price of iron is very fluctuating, on account of the varying quantities in the market at different times. Just now it is very low; it has been down to $32½ a ton in gold, and it occasionally goes up to $50. Any mercantile house that would attempt to buy up the iron at present in the market, might to-morrow raise the price to the latter figure. The economics of the case, however, appear to be such as to give the Oregon smelters a permanent advantage over shippers from the East of about $8 a ton.

The first effect of a local production of iron will be to put an end to so great a fluctuation of prices in iron. When any important work is to be begun requiring a quantity of iron, there will be no occasion to look for undue and unexpected expenditures chargeable to speculation, or to scarcity of iron in the market.

Owing to the necessity of underbidding imported iron, another effect will be the permanent cheapening of the average price of iron in the Pacific States.

So great is the demand at present for iron on this coast, not merely for railroad purposes, but also for ordinary engineering and manufacturing purposes, that the success of the Oswego works will probably cause two or three more stacks to be set in operation soon in other localities where iron ores have been found abundantly, but where the deposits have heretofore received no attention by reason of the adverseness of the proportions of cost, in the items of production and shipment.

In these particulars the Oregon Iron Works are very favorably situated. Shipping can come to the company's works and wharves, on the Willamette; and the mines are situated only two or three miles back, whence the cost of transportation amounts to only a dollar a ton by common road hauling. Extraction from the mine costs at most about $1.50 per ton; so that the total cost per ton delivered at the stack, is but $2.25 to $2.50. In New York and Connecticut the ores cost the smelters about $7.50 a ton, currency; it being found necessary generally to bring some of their ores from a great distance, as from Lake Superior, in order to obtain such a mixture as will be adapted to easy smelting—an operation rendered unnecessary by the favorable character of the Oswego ore.

Charcoal costs eight cents a bushel, being prepared in the vicinity of the works, in winter time. From 1,100 to 1,300 bushels of it are used a day, so that the price of it becomes an important item. In the east, charcoal costs from fifteen to twenty-five cents a bushel at the lowest estimate.

The company has been fortunate in procuring the services of a very competent practical iron-smelter and foundryman in the conduct of their earlier operations, where a few blunders would have sufficed to shipwreck any new and struggling enterprise: Mr. Horace Harris, who formerly run the Columbia furnace at Hudson, New York, and who has given sufficient evidence of his capacity in the quality of the iron which has been turned out thus far.

Geologically, the deposit of ore is in the nature of a bed or stratum, similar in position to the deposits of coal, and it is mined on the same principles, by parallel levels, and by side driftings. A body of ore has now been surrounded by levels which, it is estimated, will keep the furnace going for about two years and a half. It is chiefly brown hematite, containing over 80 per cent. of the oxide of iron, and yielding, on an average, as it is taken from the mine, about 50 per cent. of metal. The roofing of the deposit is a peculiar hard shaly substance, richly impregnated with oxide of iron. Timbering is accomplished very cheaply, the forests being in the neighborhood. Now that the rolling mill has become one of the established manufacturing industries of this city, the local production of pig iron seems to be entirely in consonance with the stage of general advancement to which we find we have attained. We see in these unimposing beginnings which are chronicled now, industries that will grow, and raise with them the men whose fortune grows slowly and surely at the same time, to the control of millions of capital, in less time than most of us may suspect.

The Oregon Iron Works have adapted their operations to the wants of the times, and have just turned out a score of stoves, which were cast from the furnace direct. Charcoal iron is not ordinarily used for that purpose, being too expensive, and of a better quality than is necessary; but the Oregon Company can afford to use even that, with the additional economy of requiring no re-smelting such as other foundry men have to undertake, in their competition with eastern iron. Other castings, of whatever character, for machinery, etc., can be made to order, from the furnace direct, in the same manner that stoves are cast.

In due time it is expected that rolling mills will be set in operation in the vicinity of the smelting works. A trip hammer is to be put in operation shortly, we are told, and the company will then be turning out the best quality of wrought iron.

An additional large shipment of Oregon pig is recently reported in the San Francisco market.

CONTRIBUTIONS TO OUR CABINET.—We have received a box of specimens from A. B. Butler, Mokelumne Hill, chiefly of pyrites, galena and gold; also a box from P. A. Haven, Downieville, containing many interesting lithological and mineralogical specimens, all of which will be noticed soon, with others previously received.

THE Bay View cars made their first through trip to Bay View Park, last Saturday evening, the obstructions at the Potrero cut having been entirely removed.

Agency of Hydrogen in Roasting—The Hagan Furnace.

The disintegration of water into its constituent elements of Hydrogen and Oxygen was one of the great discoveries which marked the establishment of chemistry as a science in the days of Lavoisier, when it began to be distinguished from the mysteries and empiricisms of alchemy, and ceased to be associated with stuffed crocodiles and the like mystical symbols. Paracelsus, the great humbug of antiquity, first separated hydrogen from water, without comprehending the nature of his discovery, giving it an empirical name; but it was more than a century later before any philosophic thinker hit upon the reality of water being itself a compound body, and it is to this day a most interesting experiment to see that very tangible fact proved by ocular demonstration.

Water is the result of a burning process—the burning of hydrogen with oxygen. Neither the geologists, nor the chemists, are yet wise enough to describe to us how the great fires of creation first came to pass, when the combination of the two loving affinities resulted in the flowing together of the waters of the ocean, the consequent fructification of our planet, and the vivification of all its dead atoms into an infinite world of joyous and teeming life.

To separate hydrogen from oxygen has been a most easy task in the laboratory. It is done by different methods of decomposing water, and the principle made use of is to present other objects for which oxygen entertains a greater affinity than it does for hydrogen; the oxygen then liberates the latter, at the same time that it joins the new comer. Heat alone will not decompose water, but in the condition of superheated steam it is more susceptible to outward influences. Water is decomposed, 1st, by the alkali metals at ordinary temperatures; 2d, by carbon, zinc, iron, tin, the metals of the earths, etc., at allow red heat; and 3d, in the presence of dilute acids by zinc, tin, iron and most of the metals of the earths; the last being the foundation of the usual laboratory process, whilst the second named is the principle made use of in the Hagan roasting furnace, which we are about to describe. But the simplest and most striking method of decomposing water is to cause the two poles of a galvanic battery to terminate in it, the water being first made a conductor by being slightly acidulated. The water will at once divide itself into its constituent gases—the oxygen will go to the positive, and the hydrogen to the negative pole, where they may be caught, respectively, in proper receptacles; but the hydrogen will occupy twice the space of the oxygen.

For metallurgical and industrial purposes the decomposition of water in order to burn its hydrogen—re-combining the same with oxygen—has not hitherto been done to any demonstrated practical advantage. It is to the chemical reagence of hydrogen, probably, that we must look for any available principle whereby such decomposition may be made a practical success. Two attempts have been made to apply the second principle above, to metallurgy, one by Rivot, the professor on metallurgy at the Paris *Ecole des Mines*, by the use of a reverberatory furnace where superheated steam is conducted into the flames from above, and necessarily with access of air into the furnace; the other by Dr. Wm. E. Hagan, of New York, who uses a shaft or cupola furnace, in which the superheated and decomposed steam rises from below, and the air is excluded after the wood fire has once been set in progress, by closing well the furnace doors.

Another practical utilization of the decomposition of water has been attempted for lighting purposes, in a patent French lamp, where steam is led over glowing coals, and the hydrogen so separated is caused to burn

in connection with other gases arising from the decomposition of the coal; resulting, it is said, in a brilliant light.

The Rivot process has been tried at Grass Valley, under the direction of two of Prof. Rivot's pupils, who have been back to Paris several times, and as often returning to Grass Valley, attempting repeatedly to carry out their master's theory practically; but without economical results so far as reported.

The Hagan roasting furnace was first tried in this State about three years ago, and was reported at first to be a success; but difficulties were soon encountered, and the mining public failed to be convinced of its superiority over other methods of roasting. A furnace was erected on the Point at Oakland, and another at Grass Valley, by the Pacific Ore Company; three others were erected at Mr. Bovee's mine in Calaveras County, at the Plymouth mine in Amador County, and at the Belden mine in Tuolumne County,—all of which were discontinued, though not because the desulphurization was a failure by that process, as is claimed; but experiments have never ceased for the attainment of the practical results believed to be within reach under Dr. Hagan's patent, and another furnace has recently been erected at the Enterprise mine, near Cisco, whence the Grass Valley furnace had previously in part derived its ores.

This furnace is now reported, on what appears to be pretty good authority, to be daily demonstrating that there is something, after all, in Dr. Hagan's process of roasting, which may prove of importance to the gold mining interests of this State, as a means of economizing in the item of metallurgical treatment, and increasing the number of paying mines by bringing productiveness down to a smaller assay.

We will briefly state the facts. The furnace has been modified in many details, but the principles and operations are precisely the same as heretofore described in the MINING AND SCIENTIFIC PRESS, in the circulars of the Pacific Ore Company, and also in several late publications on mining in the Pacific States, where it is spoken of as identical with the "Mason process." The furnace of the Enterprise mine has a circular ore chamber four feet in diameter and eighteen feet high, with a fire chamber at the bottom four feet deep. A pipe from a steam boiler passes in beuds over the fire, so as to superheat the steam, which then passes down to the bottom of the fire, under which it escapes from the perforated pipe so as to pass through the flames. The ore chamber is filled with ore broken to battery size; the fire chamber receives a supply of wood, which is kindled; the steam is turned on, the door of the furnace is closed as tight as possible, so as to keep the air out from the fire, and in a few minutes the blue flames of the hydrogen rise up through the ore nearly to the top of the furnace. The sulphur, antimony and arsenic in the quartz are driven off in combination with the hydrogen and oxygen, and at the end of three days the gold is perfectly free and ready to unite with the quicksilver by the common modes of amalgamation.

Dr. William B. May, the Secretary of the company, states that by this process the ore yields from four to six times the return which has hitherto been obtained by the most skillful manipulation; twenty tons of ore having produced, by ordinary amalgamation five ounces of hullion, worth $99.75, at a loss of 160 pounds, or $104 worth of quicksilver, while the same number of tons, after going through the Hagan furnace, produced 16 48-100 ounces of bullion, worth $339, at a loss of only four pounds of quicksilver. The cost of roasting is from $1 to $1.50 a ton. Additional facts will be found in a communication from Dr. May, in another column. It was on a condition that the Enterprise ores should be worked successfully, that the furnace was taken off the hands of the builders, and paid for by the mining company.

In ordinary roasting the noxious ingredients of ores—sulphur, arsenic, antimony—are volatilized by heat, or carried away in a burning combination with the oxygen of the air, for which they have a greater affinity when heated than for the metals to which they are bound. The principal burning agent has always been oxygen; the sulphur was changed by a combination with oxygen, to sulphurous acid (SO^2) and the arsenic to arsenious acid ($AS\ O^3$). Antimony, zinc and silver, besides being more or less volatilized, are partly retained in the form of sulphates, arseniates and antimonates—double compounds with oxygen and the metals to be reduced—and also partly in their original simple form. The experienced roaster can not only distinguish these various results at a glance, but he can alter them, or avoid them altogether, in accordance with the desires of the millman, to whom the products are next turned over for treatment, and who knows best, or *ought* to know, in which form the physical and chemical characteristics agree best with his particular manipulation. The ore for ordinary roasting is in a pulverized condition, and it is roasted in a reverberatory furnace.

In the Hagan furnace we have already mentioned that the air is intended to be excluded, and that the ores are broken up only to the size of one's fist, or to "battery size." The process is different from that of the English kiln roasting furnaces, for there the air has access through the door and through vent holes, and burns with the mineralized sulphur.

Oxygen and hydrogen being obtained by the decomposition of water, in a fireplace separate from the ores in the body of the cupola, the oxygen immediately unites with the carbon of the burning coals or wood, while the liberated hydrogen passes from the fire and burns, according to published circulars, "in the presence of the oxygen of the air," which it would seem is admitted into the cupola by some other opening than the fireplace; or if such be not the case or but partially the chemical result, then the roasting is effected mainly by a combination of the hydrogen directly with the sulphur, etc., making sulphureted hydrogen (HS), a gas smelling like rotten eggs, which we understand is mentioned to be a fact by the workmen who are employed at the furnace. The hydrogen flame and the resulting gases being brought into contact with the ores, the sulphur, arsenic and antimony are thereby volatilized or caused to enter into new combinations; whilst the ore remains in an oxidized and crumbling condition, so that double the usual amount of crushing can be done of it, in a stamp mill. The gold is made free; the silver remains in a metallic condition or as sulphate of silver; part of the zinc probably remains as sulphate, and some of the antimony and arsenic as antimonates, and arseniates.

We have seen specimens of this roasting—large chunks, in which the roasting process appeared to have been pretty thoroughly accomplished; but it is impossible to speak with any degree of certainty as to the results, until we have a series of comparative assays for the sulphur and other mineralizing ingredients remaining, after undergoing this and the ordinary roasting processes. At the Enterprise mine, it may be well to state that the "sulphurets" consist chiefly of arsenical pyrites.

As to the closeness to which ores can be worked after being submitted to the Hagan treatment, the persons who hold the patent appear to be duly modest, and not at all desirous that any hullaballo should be raised; but they claim that the results shown speak loudly enough, and they invite anybody who is interested to go to the spot, to study the furnace at Cisco,—take their own notes, and make their own assays,—for which every facility will be afforded.

TECHNICAL EDUCATION.—At the instance of the Royal Commission on Technical Education, the ministers of Great Britain residing in foreign countries, have furnished reports upon the status of technical education abroad, the publication of which fills a volume of 550 pages. In Bavaria a good system is in force, much attention being paid to art; in Prussia technical education is brought to the greatest perfection, and is immediately under the care of the State. The general purport of the book is that technical education is of recent growth in most of the countries of Europe, and that much scope for development exists, but that several European countries must be considered in advance of England.

DEATH OF A MECHANICIAN.—Edwin A. Stevens, of Hoboken, the originator of the well known "Steven's Battery," which cost over $1,000,000, and was never accepted by the Government, died recently at Paris, bequeathing to his children a fortune of $18,000,000.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

THE fame of the celebrated PLANTATION BITTERS has no parallel in the history of Medicine. The thousands upon thousands of bottles that are made and sold daily is but proof positive of their wonderful virtues. Thousands of certificates can be produced showing the efficacy and certainty of the cures which they effect, and the Medical Fraternity, usually so jealous of anything which causes persons to think and doctor for themselves, are compelled to acknowledge its efficacy and wonderful virtues, and prescribe them for those who seek their advice. They are sold by all of our druggists. *

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instant-
ly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 652 Market street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ANVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

Support Home Manufactures.
California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
SAFETY FUSE,
A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

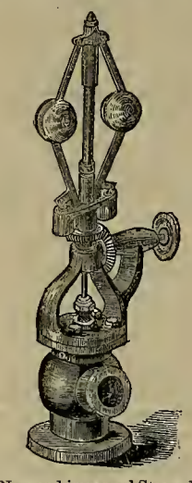
Fine or Tubular **Boilers,** with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.
Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.
Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.
To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.
Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care
To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf



HYDROSTATIC WORKS.
SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,
No. 747 Mission Street, bet. Third and Fourth.
House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.
I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single-acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered to any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country. I have now on exhibition at the State Fair thirteen Pumps in brass and iron, all of my own make, which can be seen at my place after the close of the Fair.
I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom. Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.
☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair.
☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-1t

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.
Pacific Iron Works.
First and Fremont Streets,
SAN FRANCISCO.
Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.
Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chalience Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.
Castings of every description, Iron and Brass.
We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.
Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

1v17tf

MEXICO.—The last political and financial news from this Republic is satisfactory. Our correspondents inform us that the country throughout is in a pacific state; that Señor Romero, Minister of the Treasury, has informed several mine owners that Congress would next session (October) pass a hill, allowing the export of gold and bar silver. Government had reduced the national dues 3 per cent., and those on mines 1½ per cent, There was a general desire and conviction among three-fourths of the members in Congress for carrying out free trade principles. Mr. Romero's long residence at Washington as Minister Plenipotentiary was considered a most favorable circumstance for supporting those views, as he himself is a great advocate of free trade. Mr. Romero had likewise informed foreign mine owners that everything would be done to favor their interests, and that his Government would do everything to induce foreign capitalists to enter into mining and other speculations, by passing in Congress many measures for the special protection of mining and other branches of industry. A hill had been also passed in Congress for the suppression of highway robbery, and for establishing martial law in all the provinces, by which minor authorities could at once proceed to judge and convict within 48 hours, and apply capital punishment. We may here call attention to the circular published in this day's *Journal* of the New British Mining Agency, that has been established in the city of Mexico by Mr. Stewart Auld, who is so well known in connection with mineral industry. —*London Mining Journal.*

NEW PRINCIPLE IN CONCENTRATION—DRY METHOD.—A patent has been obtained in Washington and Ottawa, by S. T. Pearce, the Superintendent of the Buckingham Plumbago Works, Canada, for a new dry method of concentrating all kinds of ore, by the employment of centrifugal force in connection with graduated receivers; doing away with the use of water, by which so much mineral is now lost. It is now claimed that ore separation is done by this method by mechanical means alone, without the employment of manual labor, and that it is as simple as the filling of grain.

[Written for the Mining and Scientific Press.]

The Hagan Furnace.

EDITORS OF THE MINING AND SCIENTIFIC PRESS:—The results attending the working of the Hagan Furnace Process, at the mill of the Enterprise Gold and Silver Mining Company, are so remarkable in their character, and so important in their bearing upon the quartz interest of the Pacific Coast, that the undersigned, Secretary of that Company, deems it due to the public that a statement of the facts should be widely published.

It is well known that the ore of the Enterprise mine has been regarded as one of the most refractory of the California gold ores, and that it has hitherto successfully resisted the almost innumerable attempts of the most skillful metallurgists who have sought to reduce it. No chemical agent could be found which would tame its rebellious nature or make it susceptible of amalgamation, and the Trustees were at a loss to know what experiment next to try. The Hagan process having been brought to their notice, they entered into a contract with the Pacific Ore Company, of San Francisco, for the erection of a Hagan Furnace, the acceptance of which was conditioned upon the successful treatment of their ore by that method, and it is but proper to say that but little expectation of success was entertained by the Trustees, so hopeless did the case seem. Indeed, during the erection of the furnace, and subsequently, every effort was put forth to find some way of conquering the ore, and much money was spent for this object, but without successful results. The last working of 20 tons, under the superintendence of a skillful and experienced amalgamator, returned only about one hundred dollars for the lot (less than five dollars per ton), while the value of the quicksilver lost in the working amounted at the lowest estimate to $105,—*being about five dollars more than the whole value of the bullion realized from the twenty tons.*

The Hagan Furnace was now set to work, and up to this time we have received the returns from fifty-five tons of the ore treated by that method, under our own supervision, and we should have remarked that these fifty-five tons seemed identical in character and value with the twenty tons previously worked, having been carefully assorted with a view to uniformity and for the purpose of a rigid test and comparison of results.

The total bullion returned from these fifty-five tons is the sum of $1,015.50, equal to $18.52 per ton, or nearly four times as much as the best returns we were able to get by any other method of working. It is hardly necessary to pronounce such results a very decided success, in view of which the Company have accepted the furnace. And the conviction cannot be resisted by us that the Hagan process is a complete solution of the whole question of the treatment of sulphuret ores—and that it opens up to the public use the way to secure all that vast mineral wealth which has been so long locked securely within the refractory ores of this coast. In this conviction, the undersigned most heartily recommends the Hagan method of reduction to the earnest and careful investigation of all interested in quartz mining, being fully satisfied that such an investigation will lead to its general adoption for the treatment of all refractory ores.

(Signed) WM. B. MAY,

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

SAN FRANCISCO
HYGEIAN HOME WATER CURE.
No. 637 California street, opposite St. Mary's Cathedral.
WE HAVE NOW THE MOST EXTENSIVE AND COMplete Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest pursuance of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a Home combining all the Hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the prices for gentlemen to $50 per month; to ladies from $15 to $20 per week for board and treatment.

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

Mining Secretary.
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

THE sale of town lots at Vallejo, on the Frisbie estate, and immediately contiguous to the terminous of the California and Pacific Railroad, took place this week at Platt's Hall. About 600 people were present. The bidding was fair, but not enthusiastic. Lots of about 50 feet front by 90 to 100 deep, brought from $440 to $200. They mostly went off in batches of five lots to a purchaser. The sum realized did not equal the expectations of the sellers.

CHINESE TENEMENTS AND THE STEAM FIRE ENGINE.—The city of Singapore has adopted the steam fire engine system, with a regular hired fire brigade, for that city of tropical heats and destructible Chinese tenements. The Chinese and Japanese will not be long in learning the use that there is in steam fire engines.

A METHOD has been discovered of separating the honey from the comb, by centrifugal force. The process leaves the cells so little injured that the sweet creatures that fill them can go to work filling them again after a short season spent in repairs.

IT is stated that the celebrated yacht Henrietta, belonging to James Gordon Bennett, Jr., will leave New York in a few days for San Francisco.

San Francisco, August 15th, 1868. 7v17-3m

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side tor months, and make them good as new. Cet them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash-boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

BUERK'S
Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada is about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.

Californians in the China Gold Mines.

Prospecting adventures in China are described by a correspondent from Chefoo, dated Aug. 8th, as follows:

"We organized a prospecting party of three—a Californian, an Australian, and a General Ward's man—immediately upon our arrival at Tulloch's Temple, twenty miles from Chefoo, on the 29th ult. Our first effort was near a Mandarin's tomb, where the Chinese said immense specimens were buried. A shaft was sunk, but a storm coming on flooded our claim, and we retired, demoralized, back to camp. The next day we prospected for some six miles to the northward, and toward Lookout Mountain, fifteen miles south of Chefoo. Our China boys and muleteers early evinced a desire to fall back upon Chefoo, but we kept them in company, and went on seeking gold in the deep ravines by the wayside. We raised mica, mundic, black sand, and everything except gold, and were going in after that with a will, when the headman of a village near by, ordered our packs to 'move on.' We moved on, as otherwise we would have been obliged to do our own packing. At the Goldeu Hill Temple, fifteen miles south of Chefoo, we halted and put up for the night. That afternoon a rough map of the country was made from the top of Lookout Mountain.

The next day we went down to a creek near by, and watched some thirty Chineso washing out gold. It was after the rains, and they were evidently making a good thing of it. They used a shallow wooden vessel, something like a bread-tray, a blunted rake, dipper, and spade, and got through a great deal more earth than we could with our tin pans. A portion of the gold was evidently lost in the raking, yet nearly all the trays showed at least 30 cents after a few minutes washing. We selected a spot some little distaace above these fellows, and with a pan soon brought up the color with two shovelfuls only. This satisfied us of the richness of the creek, and when we went back to our quarters, the Chinese followed us with their dust, some of which we bought at a fair exchange for Mexicans. After making another satisfactory prospecting tour of some twelve miles among the hills and ravines, we changed our camp to a range of mountains which bordered the view at a distance of fourteen miles to tho southwest of Lookout Mountain. The mountain sides were very rough and broken by deep and ahrupt ravines, and sometimes difficult of passage; yet cultivation extended to all available places, and for the 150 miles or more that we traveled during our ten days excursion, richly cultivated valleys and terraced hills, with a teeming population of Chinese, met the gaze everywhere, and a fraction of the last was always at hand to disconcert us when we believe ourselves most aloae in our deep conferences with the God of Mammon.

We found the country people very friendly and ready to meet us half way with their chickens and eggs, while the head men of the villages seemed to be never more satisfied than when they kept us moving on."

After describing some unsuccessful prospecting in other directions, the party was finally brought up 28 miles southeast from Chefoo, and forced to heat a retroat from want of supplies, in the following manner:

"At early dawn a village was visited, but a mandarin's proclamation had been there before us; and the villagers made no sign, but evidently wished us well away. Our muleteers were clamerous for food, and for ourselves aid and comfort were needed; but the headman pointed to the notice forbidding any aid and comfort being given to foreigners, or any other roaming vagahond scoundrels, seeking convenient places to dig for gold! A learned siuologue of the party quoted some of the goldeu maxims of Confucius, (who, by the by, was a Shantungite, horn, hred and huried,) consigning in the most coucise terms all of his countrymen who would not feed a heggar in distress to the lowest depths of bad Fungshueydom; hut it was of no avail, and after a brief look at the hills to satisfy us that gold was indicated thereabouts, we packed up and left for Chefoo again."

Chefoo correspondents of the Chinese newspapers speak of what Californians may he expected to do in the gold mines. Tho mines are prohibited to foreigners, hut a great many go there in spite of the opposition of the Governors or Taouates. Chineso who have been in California go to work without leave or license. The newspaper writers call vigorously for a immigration of Californians. The Shanghai *News Letter* says:

"We think it not improhahlo that about 1846 the Alcades of Yerba Buena and Montrey were quite as troublosomo to the captains of the few hide ships that went there, as the Taoatues of to-day; and that the U. S. Government did not take any strong measures in the matter; hut after Captain Sutter found gold on his farm—the inference is ohvious."

Academy of Sciences.

The Society met at their rooms on Monday evening, September 21st, at 8 o'clock, President Blake in the chair. A resolution, offered hy Dr. Stout and seconded hy Dr. Logau, was carried, tendering the thauks of the Society to Col. R. S. Williamson, for the gift of his own work "On the Uso of the Barometer on Surveys and Reconnoissances." The thanks of the Society were also voted to their Secretary, Mr. Elisha Brooks, for his gift of a cataloguo of the library, prepared by himself; and also to Dr. Logan, who presented some specimens of Peles' hair, or *obsidian*, from the crater of the volcano of Mauna Loa, in the Sandwich Islands.

RECENT ATMOSPHERIC PHENOMENA.

A discussiou ensued relative to the remarkahle appearauce of the sun during the late smoky or foggy condition of the atmosphere. It was generally conceded that the obscuratiou could not have proceeded from the hurning of forests in Oregou or in Marin county, although soveral interesting facts were cited tendiug to establish that origin. The sun, viewed through smoke alouo, assumes a red color, while its appearance on this occasion was a pale puce color, or pink, or violet, as the density varied. The more favorite opinion seemed to attrihute the phenomena to the existence of saline or sillicious matter floating iu the atmosphere. The dryness of the air had probably ahsorbed the moisture from the fog, leaving the saliue particles snspended, as particles of ice frequently are, hy which the sun's rays were acted upon. This condition of "dry fog" is common in northern Europe, where similar appearances are observed.

THE OCTOPUS, OR CUTTLE-FISH.

Dr. Stout offered to the inspection of the Society the dissected parts of a specimen of the octopus, or cuttle-fish, for which he was iudehted to Mr. Aztredo, of this city. He alluded to the terrific but exaggerated description of this animal by Victor Hugo, in his "Toilers of the Sea," who, although considered to be a naturalist, had evidently never viewed the animal he described, and never properly understood the beauty of its physical construction. The Doctor exhibited a number of large and beautiful illustrations of the animal, and proceeded to explain its position in the family of the octopidæ. It is the polypus of the ancients, and the cuttle-fish or devil-fish of modern times. He described the several varieties and produced a smaller specimen which had lately come into his possession; and no one would suppose, on looking at its rather repulsive form, that so much beauty of construction oxisted in such a poor, degraded creature.

Among the curious hahits of this mollusk, the speaker described that by which he propels himself hy continually throwing out jets of water in an opposite direction to that in which he wishes to proceed, and that recently this very method of propelling vessels had heeu put into practical use—the throwing out powerful jets of water from the stern. Dr. Stout, while treating of the inaccuracies and misconceptions of the nature of the animal by Victor Hugo, fully confirmed that author's estimate of the deadly power of the devil-fish, and remarked that the specimen which he was now exhibiting could easily seize upon and destroy a swimmer with whom he might come in contact. The Doctor gavo a long and interesting analysis of the animal, and the thauks of the Society were unanimously voted to him.

Mr. White described a fish of the same character, caught some years since at Victoria, Vancouver's Island, the arms of which were as long as a man's leg, and fourteen feet in length. He added, however, that he had the very best authority for stating that in the South Sea a captured sperm whale threw up in his agony a cuttle-fish, one of whose arms measured twenty-eight feet in length, the fish being nearly sixty feet across.

MOUNT WASHINGTON RAILROAD.—This is now nearly finished. It is three miles long, nearly straight, rises up the mountain at a grade of 1 foot in 5, or 1700 feet to the mile; and the locomotive travels in cogs on a middle rail.

Mining Notices—Continued.

Bunker Hill Quartz Mining Company. Location of Works: Near Amador, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of May, 1868, an assessment (No. 8) of ten dollars ($10) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to DANIEL PALMER, No. 134 State street, Boston, Massachusetts.

And whereas said assessment was not duly advertised as required by law, and as contemplated by the resolution making the levy, at a subsequent meeting of the Board of Trustees, held September 2d, 1868, it was resolved, that—

Any stock upon which said assessment shall remain unpaid on the sixth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WALES L. PALMER, Secretary.

Office, No. 19 First street, San Francisco, California. sep5

Chipioneua Mining Company—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board Trustees of said Company, held on the seventh day of September, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street, up stairs.

Any stock upon which said assessment shall remain unpaid on the ninth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LONSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. sep12

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Diamond Copper Mining Company. Location of Rockland District, Ocl Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1867, an assessment of two ($2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 40 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary.

Office, Room 40 Merchants' Exchange Building, California street, San Francisco, Cal. sep12

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of September, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARO, Secretary.

Office, 408 California street, San Francisco. sep19

Nevada County Gold Mining Company, Nevada County, California.

Notice is hereby given to the Stockholders of the Nevada County Gold Mining Company, that a meeting will be held at the office of the Company, No. 9 Merchants' Exchange, California street, San Francisco, on MONDAY, the fifth day of October, 1868, at the hour of 12 o'clock, noon, for the purpose of electing officers, and the transaction of such other business as shall come before the meeting.

[Signed] E. S. CURTIS, } Trustees and
B. WELLMAN, } Stockholders.
WM. NEWTON MEEKS, } Stockholders.
CHAS. BALSEY, }
San Francisco, Sept. 9th, 1868. sep13

North American Wood Preserving Company. Location of Works: San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the third day of September, 1868, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Room 32 New Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. S. LAKE, Secretary.

Office, 32 New Merchants' Exchange. sep5

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

Machinery.

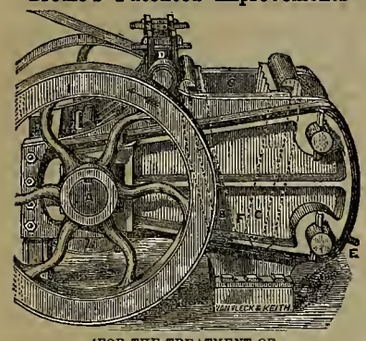
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

for rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everre-quired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved places again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Mrs. L. Schenck, for hair crosses, certificate of merit.
Mrs. D. Le Bar, for hair flowers, certificate of merit.
Mrs. H. E. Bert, for hair flowers, certificate of merit.
Mrs. M. E. Dougherty, for human hair, diploma.
Mrs. C. M. Chapman, for hair rejuvenator, diploma.

CLASS 30—SECTION 3.

E. F. Lorquin, for stuffed birds, special diploma.
Mrs. E. F. Lorquin, for sea moss and shell work, diploma.
Mrs. L. Bigley, for shell tower, diploma.
Mrs. Marianus, for shell frame and sea weed, certificate of merit.
G. Kustel, for galvanized birds and fruit, diploma.
Mrs. W. P. Day, for collection of snells, certificate of merit.
George Bloomer, for collection of shells, certificate of merit.
W. E. Loomis, for collection of curiosities from the Sandwich Islands, certificate of merit.
M. S. Phinney, for engraved walrus tusks and whale teeth, diploma.

CLASS 30—SECTION 4.

E. Hawthorne, for patent fire escape, diploma.
J. W. Nagle, for perfumery, certificate of merit.
Sydney Smith, for fluat in fleet, certificate of merit.
John S. Hittell, for *Resources of California*, diploma.
J. E. Bender, for furniture renovation, diploma.
Meyer & Co., for blanket cleaning, diploma.
H. Olsen, for life preserver, certificate of merit.
L. P. McCarthy, for card castle, certificate of merit.

INVENTORS' DEPARTMENT.

Coffin & Slandish, for steam plow, gold medal.
C. Newman, for glass smelting pot, silver medal.

HIGHEST AWARD.

Pacific Tannery and Boot and Shoe Company, for thorough exhibit of leather and its manufacture from the hide to finest finished work, Institute gold medal.

METHOD OF IMPROVING POOR COAL.—It is stated that a Swiss professor of mineralogy has discovered a means of communicating to the fossil coal which abounds in the valley of the Alps all the qualities of the best fossil English coal. The process employed consists of an inexpensive chemical preparation by which the coal of the Alps is mixed with naphtha and bitumen obtained in large quantities from the Apennines. If experiments now being made are attended with a satisfactory result, one can only augur favorably from this discovery, the financial and economic consequences of which would be very great and important for Italy, which has now to obtain its coal supplies wholly abroad. It may be well to remark that the new process is already employed in France, and that the Carvin Company has made arrangements for the working in the departments of the Nord and the Pas-de-Calais of a patent taken out on the subject.—*Colliery Guardian.*

CAPITAL AND LABOR.—On Saturday evening it was finally resolved, at a meeting of the Drinkfield Iron Company, the shareholders of which are principally ironworkers of the north of England, to turn the undertaking into a cooperative concern. The works, which are at Darlington, where the meeting was held under the presidency of Mr. Spark, have cost something like £10,000, and by this experiment it is sought to find a solution on a small scale of the capital and labor question which has occasioned such bitter strife between employer and employed. The meeting was addressed by Mr. Kane, President of the National Union of Ironworkers, and Mr. M'Donald representing over 20,000 miners. These gentlemen stated that this society would enable the workmen to become acquainted with business matters, and give them, as it were, a technical education. It was agreed that the works should be taken by the cooperative company at a valuation to be made by a competent authority, and every assurance was given that the scheme would be a success.—*Colliery Guardian.*

WHAT THE UNION PACIFIC PROMISES.—The Cheyenne *Star* says the trains going West are taking from seventy-five to a hundred workmen daily, and that there is no doubt but that the road will reach Green River this year. It is now completed to the foot of Elk Mountains. There is a splendid coal bed within half a mile of the track, and the coal is said to be superior to that found in Iowa.

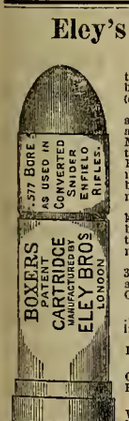
COAL CONTRACT IN THE WILDERNESS.—Large tracts of coal lands have been lately discovered along the line of the Union Pacific road a few miles west of Rock Creek, Wyoming Territory, and one party has a contract to furnish one hundred thousand tons to the railroad. It is coal of a superior quality, and is found within one mile of the main track.

IT is stated that a gold vein varying in width from six inches to one foot, and traceable on the surface for 3,000 feet, has been discovered on the lands of the Hudson River Slate Company, in Duchess County, New York. An assay of the quartz rock taken from this vein shows that it contains $15 45 of gold per ton, besides 20 per cent. of silver.

A PORCUPINE, a rodent quadruped of the genus *Hystrix* of Linnæus, was recently killed at Cherokee, Butte county.

TREATMENT OF ORES SUITABLE FOR CHLORINATION. — The Clorination process is working wonders far and wide. A gentleman who owns a mill and mine over near Placerville informed us a few days since, that after working off the top or decomposed free gold ore, the mine failed to pay expenses and he closed the mill. Some parties from San Francisco came along a few months since and offered a fair price for the use of the property, which he accepted and they in the face of scoffs and jeers from "practical" millmen, employed a young man who had never had anything to do with a mill before, a student fresh from one of the private mining schools of San Francisco, who went to work and put the mill in order and now the same rock that before would not pay six dollars per ton is turning out sixty, and making a splendid profit to all concerned. The chlorination process has proved profitable in every case tried, where there has been a good supply of sulphurets and under good management throughout California, and is to be introduced in Arizona. Preparatory to the introduction of chlorine gas and the subsequent manipulations—which extract 90 to 96 per cent. of all the precious metals contained in the ore—the ore must be roasted, therefore any cheapening of this now expensive operation will be hailed as a benefaction. Cheap and rapid pulverization, concentration, mechanical roasting and chlorination combined, seem to be the "coming plan," which shall make mining permanently profitable.—*Alpine Miner.*

BRIGHAM YOUNG ON MINING.—The Mormon autocrat recently made the following speech to several of the faithful:



"Gentlemen," said he, "I understand some of you are going to the Pharanagat mines. You are very hopeful, I observe, but you will lose your money; mark my words. The ore is there, true enough; but not one mine in fifty can be profitably worked in America until wages are 25 cents a day, as in Germany, instead of $6 as at your mines, the expense of reducing your ore will swallow up all the revenue and much more. It won't do. What would my community be to-day if it had taken to mining instead of agriculture? Set one hundred men to mining and ten to farming, and at the end of ten years the ten will be worth more than the one hundred, and probably have to feed them gratuitously. You say that it is possible that my views on this subject may he changed. They may be enlarged, and for your sakes I hope they will. But I can only repent my fullest conviction that you are doomed to bitter disappointments and heavy losses."

TIN AND GARNET.—Mr. J. Alden Smith, of the *Register*, who is perfectly reliable as a mineralogist, pronounces the Summit County supposed tin ore an iron garnet, and not in the slightest degree related to tin ore. If it weren't so common, we would say, just as we thought. We did suspect as much.—*Rocky Mountain News, Sept, 2d.*

THE Smith gold mine, in Spottsylvania County, Virginia, containing 100 acres, was recently sold at a trust sale for $1,400. A year or two ago Northern capitalists bought it for $15,000. The boiler used in its working brought $675, and the other machinery $325—aggregating $2,400.

CHILI solicits contributions to a grand Agricultural Fair, to be held April 1st, 1869. This is progress.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

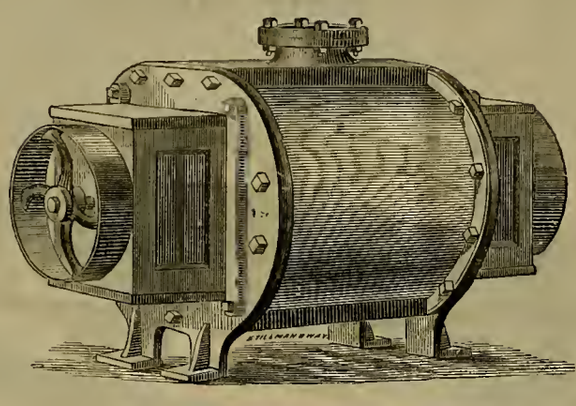
Makers of BOXER CARTRIDGES, .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M, and 7 M, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.



ELEY BROTHERS,
Gray's Inn Road, London, W. C.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

MEUSSDORFFER,
HAT MANUFACTURER
And dealer in
Hats and Caps
AT WHOLESALE AND RETAIL.

635 and 637 Commercial street.....San Francisco.
125 J street.....Sacramento.
Corner of D and Second streets.....Marysville.
72 Front street.....Portland, Oregon.

Our wholesale House, 623 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest, assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m

New Potato Digger.

Parties interested in saving considerable time and money by using the

PACIFIC
POTATO DIGGER AND SACKER,

Should not delay the present opportunity of having one in time for the late Potato crop this season.

☞ Liberal terms to Farmers' clubs ordering more than one. This arrangement secures to members in rotation the great benefit of a machine, and materially reduces their outlay. A Potato Digger of this kind is sufficiently strong for general ranch purposes, and will dig, clean and separate, according to sizes, and sack six to seven acres of potatoes daily, besides the important saving of so much time, and at less than half the cost of the present expensive and dilatory method by hand.

It would require one man from forty to fifty days to accomplish the same amount of work.

A WORKING MODEL may be seen from 11 to 12 and from 1 till 5 o'clock daily, in operation until the 10th of October, at Risdon's Machine Works, corner of Beale and Howard streets, San Francisco.

12v17-1m

OIL STOVES!

MORRILL'S
Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

JOHN PERRY,
MANUFACTURER OF
Cocoanut Matting, Rugs, Mats, Etc.
And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purposes:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to palm, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16-6m

$100 A MONTH SALARY WILL BE PAID FOR Agents, male or female, in a new, pleasant, permanent business. Full particulars FREE by return mail, of sample, retailing at $4 50, for 50 cents. A. D. BOWMAN & CO., No. 4 Broad street, New York.

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

UNIVERSITY COLLEGE.—Messrs. Williams & Son, architects, are progressing with the erection of the University Mound, beyond Bay View. The location is about five miles from the City Hall. The building is of frame, and will have a frontage of ninety-six feet, with a depth of eighty-five feet. The style is modern Gothic. It will form a complete building of itself, but it is intended in future days to add to its dimensions. The entire structure is now ready for plastering, and when completed will cost $20,000. The institution is intended to board and educate students, and is provided with spacious class, dining, sleeping and bath rooms. When ready for occupation, it is understood the College on Stockton street, near Geary, will be discontinued, and the students will afterward pursue their studies at University Mound.

THE earthquake in South America was felt all around the Pacific. By the steamer from China and Japan we have intelligence that a great tidal wave was observed at Yokohama, at three o'clock in the afternoon of August 15th, two days after the shocks began in Peru.

A BRICK chimney, one hundred feet high, in Worcester, Massachusetts, has been moved 400 feet, without stays or tops.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

AMERICAN
(WALTHAM)
WATCHES,
THE BEST! THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

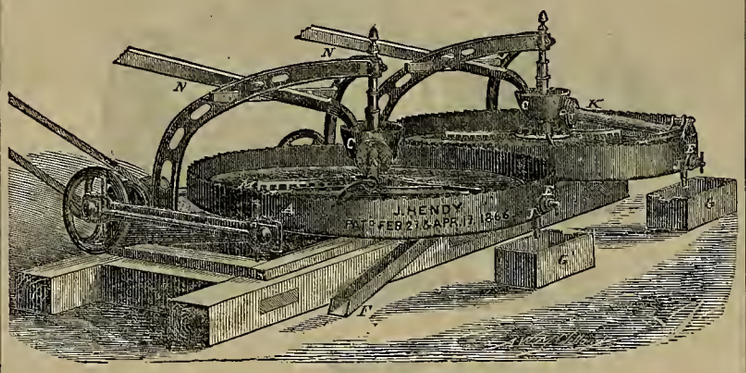
A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer a nother to the jobber, thus doubling the cost of the Imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.



There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first-class dealers in the United States and British Provinces.

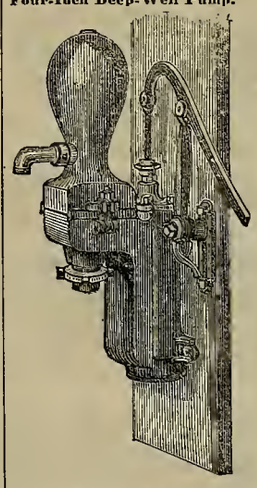
HANSBROW'S CHALLENGE
Deep-Well, Mining and Double-Cylinder Patent Pumps.



Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,
☞ Send for a descriptive Circular.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Exploration of the Interior of Russian America.

Some account was given in our last number of the explorations of Mr. W. H. Dall in the territory of the Youkon River, Russian America, or Alaska as it is to be called hereafter. We are now able to add some of the results of Mr. Dall's laborious journeyings in that country, which will be received with favor as additional contributions to geographical science.

Other attachés of the Western Union Telegraph Expedition—which proved a failure as to construction, but none the less a historical success in having added Alaska, and possibly the veritable North Pole, to our dominions—have likewise furnished data concerning that country. The best obtainable maps of Alaska are Lloyd's new wall map of the United States, (1867) in which the route of the proposed telegraph is laid down, and Britton's map, engraved recently for Gen. Halleck, containing all the notes of the Telegraph Company; and in recent numbers of the *London Illustrated News*, Mr. Whymper, the artist of the expedition, has furnished a series of interesting sketches from the Lower Youkon Territory, several of which have been copied in the last number of *Harper's Weekly*.

THE COUNTRY EXPLORED.

To distinguish this far Northwestern country from Sitka—a thousand miles nearer to us and on the southern side of the mountains forming the backbone of Alaska—it is named, after the great river which flows through it, as the Youkon Territory.

The line of explorations carried on was, especially from the mouth of the Youkon to the junction of that river with the Porcupine; the coast from its mouth to seventy-five miles north of St. Michael's (1) and thence to the Youkon, across a portage of perhaps seventy-five miles, more or less, in length. Also, as careful an examination as possible was made of the various sloughs or divisions of the river itself; particularly one, a slough of fifty miles in length, called the Shageluk Slough (12).

GEOGRAPHICAL ERRORS.

In an article on the geography of Youkon Territory it is first necessary to correct a few very old and flagrant errors. 1st. In most atlases we find a large river, named the Colville, (11) emptying into the Arctic Ocean. This is an error. It is an insignificant stream of no length worth mentioning. 2d. The coast between Cape Romanzoff (14) and the head of Norton Sound (b) is laid down with gross errors and is utterly unreliable even in the best charts. 3d. The Esquimaux name of one small mouth of the Youkon Delta is Kwichpak (a). This name is erroneously applied to the whole river, on which for a thousand miles the Indians call themselves the Youkonicatana, or "Men of the Youkon." 4th. The general course of the river, when laid down at all, is much too far to the south and west, except near the mouth. The junction of the Porcupine and Youkon is near the boundary line, a little north of the Arctic Circle. There is one large river which has been confounded with the Youkon, emptying into the Youkon

half-way between the English Fort and the Russian Fort, called by the natives the Tanana, or River of Mountains.

FORTS.

The Russians have posts at the head of Bristol Bay; at Nulato, (6) St. Michael's, (1) Andreaffsky, (10) and the Mission, (9); also one at Unalakleet, (16) and a solitary house at the mouth of the river. There are no more in the Youkon Territory. The Hudson Bay Company has one post at the mouth of the Porcupine River, some fifty miles west of the boundary, which is called Fort Youkon (8).

MOUNTAINS AND TOPOGRAPHY.

There are no high mountains north of the backbone of the Peninsula—the range which almost skirts the southern coast—except a short, isolated chain, containing some seven peaks, which is visible in a northwesterly direction from Fort Youkon, (8) trending in the same general direction. These are the only mountains in Youkon Territory that have snow upon them throughout the summer.

There are two isolated mountains noted as landmarks on the Youkon River; one of them is just above Nulato, (17) and is called by the Russians Koyoukuk Sopka, or "Volcano-like Mountain;" it is not very high—about 5,000 feet—but a marked feature nevertheless in going up the river; and the other is as great a landmark for the Lower Youkon as that just named is for the Upper, being situated at the lower bend (18) and called the Kusillvak "Gora," or Mountain; it is about 6,500 feet in height. The rest of the mountains are mere hills that cannot be distinguished from one another.

The country in general cannot be called either marshy or mountainous; it is a mixture of marsh and low, rolling, rocky hills, covered with moss and with very little earth, except in the valleys, which are always very wet in summer; and it is wet then even on the tops of the mountains. Leading characteristics of the country are, that it is wet and foggy.

VEGETATION.

On the coasts there is scarcely any trace of vegetation whatever. As the traveler advances inland, particularly along the small rivers and up the valley of the Youkon, he soon comes to a very densely wooded country. The trees are of medium size, and are white spruce, willow, poplar, and birch, preponderating in the order named; the diameter ranging from eight inches to two and a half feet, a very common average being one and a half feet. A strip of about one hundred miles only, along the coast, is bare. Grasses grow in the interior in great profusion and to a luxuriant height. Vegetables cannot be raised, except turnips, radishes, and lettuce. Potatoes grow to about the size of a pea. At Fort Youkon they live on moose meat chiefly

ANIMALS.

Along the coast the principal animal is the reindeer, the same species as in Lapland. It frequents the hilly country, but at certain seasons descends into the plains. The moose frequent the low country in the interior, and are never found in the mountains. On going up the Youkon they are not found until after passing the great bend at Nulato (17). Towards the mountains eastward from Fort Youkon, (8) the mountain goat is found; besides which there are found throughout the Territory the black, red and brown bear; the black, red, gray, blue and white fox; the mink, otter, martin, muskrat, Arctic hare and Arctic rabbit. Ermine are scarce. Eskimaux dogs, like those at the City Gardens, are used to draw sleds.

BIRDS.

Aquatic fowl are common on the coast, of every description under the sun, and some of them go up the rivers, marking different zones. In spring there is always a great accession of water fowl. The land birds are chiefly summer birds, and there are some species that remain during the winter, as the pine grosbeak, the red-poll, woodpeckers and crows. There are three kinds of grouse, the black, white and gray, and various hawks, which remain in the winter.

INSECTS.

Insects are rare, except mosquitos, which make up for the rest in more than tropical profusion, lasting from the middle of May till the end of July. A cubic yard of them would weigh two or three pounds; they can not be scared, and will go through fire and water. One's lap is soon full of dead mosquitos. It is impossible to live without wearing nets.

TEMPERATURE.

The temperature is most severe in December, January, and the first part of February. It varies all the way from zero to 69° Fah., below. There are sometimes warm days, and occasionally there are winters when the average cold is not very intense; but the cold winters are the most pleasant and healthy, and better adapted to traveling, because then there is not so much snow. In warm winters, like the last, it is rainy and damp, and very many of the Indians die. It is colder in the interior than on the coast, but the winds make it more inhospitable. At Fort Youkon it is 30° colder, at least, than at the mouth of the river. In summer it is cooler on the coast, and hotter in the interior.

INSTRUMENTAL OBSERVATIONS

were restricted to the use of the compass, thermometer and barometer. The Youkon was surveyed by bearings without making corrections on the spot for the variation of the needle, which was found in some places to be as much as 23° from the north star. The distances were estimated by the rate of paddling, and corrected on coming down by the rate of the current, which averaged 3½ knots an hour.

No observations were taken for latitude, but the approximate latitude of Fort Youkon (8) was ascertained to be near the Arctic Circle, or a very little above it, by the circumstances that the sun does not rise above the horizon except with the Arctic Circle, on the shortest day at midnight; and at Fort Youkon it remains above the horizon all night at that time for a few days.

Interesting notes concerning the Indians and their relationship with Asia, and conveying a good idea of the geology and mineralogy of the country, are necessarily laid aside till next week.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Earthquakes--their Causes and Periodicity.

Editors Press:—It must be admitted that earthquakes are the result of mechanical action in the earth's crust, while adjusting itself to tho ever shriuking molten mass it eontains. From the following facts and considerations, it seems that there is another force arising from a slight annual tidal motion of the molteu interior due to the combined attraction of the sun and moon, which to some extent controls the mechanical action above referred to. Dr. Robinson has reported to the British Association that "He found the entire mass of the hill on whieh the Armagh Observatory is erected, to be slightly, but to an astronomer, perceptibly tilted or canted, at one season of the year to the east, and at another season to the west." And what is moro startling to the astronomical world, the Greenwich transit iustrument, the very Ark of the Covenaut of scientific certainty itself, has wavered. The High Priest of that *sanctum sanctorum* of scieuce, Prof. Airey, the astronomer royal, makes the alarming confession, as follows: "While the construction of this instrument, and the modes of observation with it, have given a warrantee such as the world never possessed before, there havo been instauces where the azimuth of the iustrument, greatly to the surprise of the astronomer, *has varied four seconds*, as determined by the opposite passages of the Polar Star." Mr. Airey has no other way of explaining this than by the supposition "that the sound and firmest earth itself is in motiou."

If we refer this oscillation of the earth's crust to the annual tidal motion of the molten interior, due to the combined attractiou of sun and moon, it should follow that the periods of the greatest volcanic disturbance would be at the ebb and flow of such tide. Humboldt says: "Numerical iuquiries of the distribution of earthquakes throughout the course of the year, such as those of Von Hoff, Peter Merian, and Friedrich Hoffman, bear testimony to their frequency at the periods of the equinoxes." They should also be most frequent at or near the period of the conjunction of the sun and moon, or when the lifting force of the tidal waves approach each other, between the last quarter and new moon. So far as I have determined, such seems to be the fact. Then earthquakes should occur most frequently iu the daytime, within a few hours after tho sun passes the meridian—and such also seems to be the fact,

The frequent auuual earthquakes are due to the tidal motion of the molten interior, which causes a slight variation in the crust of the earth, while the destructive earthquakes are due to the gradual sinking of the molten mass, and occur after lengthened periods of time, wheu the earth's crust is incapable of longer resisting the immenso lateral pressure. It is not improbable that when the laws which govern volcauic action are better uuderstood, and a proper series of observations instituted, that distinctive earthquakes may be foretold, and thus be disarmed of their terrors. Humboldt say: "Lima is frequently visited by earthquakes, and several times the city has been reduced to a mass of ruins. At an average forty-five shocks may he counted on in a year, most of whieh occur in the latter part of October, iu November, December, January, May and June. Long habit and the very prevalent opinion that dangerous shocks are to be apprehended only two or three tiues in the course of a century, cause tho faint oscillations of the soil to be regarded in Lima with scarcely more attentiou than a hailstorm in the temperate zone. Experience gives reason to expect the visitation of two desolating earthquakes in a century. The period between the two is from forty to sixty years. The most considerable catastrophes experienced in Lima since Europeans have visited the west coast of South America, happened in the years 1586, 1630, 1687, 1713, 1746, 1806," and uow again iu 1868. Now that the period of destructive earthquakes has again arrived, it is the part of wisdom for the inhabitants residing along the liues of disturbance where such shocks have been kuowu to occur, to adopt all tho known means of safety wbich are practicable.

In early geological periods, when the crust of the earth was thiuner, and had less power of resistance, there must have been a *daily* tidal motion of the mass within, which gave a longitudinal direction to the corrugation and folding of the rocks, as is exhibited in the early formed slates and the existiug mountain ranges.

Smelting Operations in Owen's Valley.

Editors Press:—I have just received from Mr. P. Desormeaux, whose card find enclosed, a report of the first attempt at smelting, on a large scale, in the Cerro Gordo District.

The most important result of this trial, has been to iudicate the improvements which are required. Operations will be continued immediately, and Mr. Desormeaux is confident of obtaiuing much better results. The amount of silver contained iu the ore treated is not given. I inclose the original, and my translation thereof.

The furnace of Belshaw & Elder, is now ready to commence, and two others, and smaller ones, are now in operation; results not yet known, In addition to these, several small furnaces are being operated by Mexicans and Chilenos, who indeed are tho only persons thus far, who have achieved any success in this valley.

The want of tbe Cerro Gordo District is capital, and I must say I bave never before seen so rich a couutry so neglected as this.

I will take this occasion to correct an error which appears to have found its way to the public mind in San Francisco, namely, that the small bars of silvor which appear from time to time in your city, stamped with my name, and that of Lone Pine, my present place of residence, are the product of the Kearsarge mines. Every silver bar bearing my stamp, up to this time, *came from the Cerro Gordo*, and was smelted out by the Mexicans or Chilenos, in their rude furnaces. The greater portion of the gold in these bars came from the Coso District, and is also the produce of Spanish labor and enterprise.

The Cerro Gordo bullion usually contains ouly from one to three cents of gold to the ounce. It is also an error to suppose that the ores of this district cannot be milled. On the contrary tbere is a large quantity of good milling ore to bc had, which cannot be profitably smelted, and a great deal which can be treated either way, but I am satisfied, with a great advantage on the side of milling. This class includes *all the richest silver ores**, to which lead ore must be added in the smelting furnace. A portion of the mill ores or "*metal de pie*" would require roasting, while others can be better treated without.

There is also a splendid opening for a small mill, say ten stamps, in the Hot Spring District, Mono County, which I visited last summer—another neglected spot.

The fact is the whole of Owen's Valley lies under the ban of San Francisco capitalists, simply because tbo works heretofore put up, have beeu either located where there were uo miues to justify the outlay, or they have failed to adopt suitable means for the extraction of the precious metals, as was the case with the Silver Sprout Co. last year, who, having now put up a roasting furnace, need only make proper use of it to *insure* the successful working of their ores.

But to all who may contemplate putting up mills in Owen's Valley, I say *beware of puns!* If it were not too much like an advertisement I would add, for further information, apply to the undersigned. The method which is best adapted to the treatment of the milling ores, not only of this valley but of the Comstock lode, and probably of Reese Rivor and other districts, is one that is *nowhere practiced on this coast*, nor probably, in tbe form which I contemplate, anywhere else. I await my opportunity to introduce it.

Mr, Desormeaux's report is as follows: In 60 hours of good work I smelted in my furnace 20 tons of a mixture *(lit-de-fusion)* containiug seven tons of ore, the rest beiug flux. The 20 tons produced 11,331 pounds of lead.

The expenses of smelting the 20 tons of mixture are as follows:

Labor	$150 00
Five tons charcoal, at 30 cents per bushel	150 00
One cord of wood for drying the furnace	5 00
Supervision	50 00
Tools, oil, etc	10 00
Expense of machine (for blowing by horse-power)	130 00
Total	$495 00

Expense of cupellation of 11,331 pounds lead:

Labor	$80 00
Three cords wood, at $5	15 00
Tools	2 00
Making the cupel	12 00
Total	$109 00

Total expense of smelting and cupelling, $604.
Silver produced, 771⅔ ounces.

Supposing the silver to be worth $1.25, for it ought to be .980 fine, it would be worth	$964 38
Two tons litharge at $60	120 00
	$1,084 38
Expenses to deduct	604 00
	$480 38
Deduct value of 7 tons of ore	290 00
Profit	$190 38

It will he observed that the estimated value of the silver is pretty high, and no allowance is made for expense of transporting it to San Francisco. On the other hand, Mr. Desormeaux justly observes that a great reduction of expense would be obtained by running steadily; also tbe substitution of a small steam engine for the horse-power, will effect an economy. In fine, this, with all its imperfections, is a first attempt. Charles H. Aaron.

* Argentiferous copper ores.

Interesting Discussion on the Origin of Mineral Veins.

As many of the sound and sensible amongst our energetic miners of the Pacific slopo are still groping amidst crude theories and ill-supported hypotheses, concerning the natnro of tho filling up of cracks which we now reöpen as mineral veins, the source of nearly all the minerals that are mined, and as the merits of the aqueous and igneous theories have been thoroughly canvassed by able judges, who havo long since agreed in favor of the almost applicability of tho former, as set forth in numerous published works, like Cotta's *Erzlagerslaettenlehre*, the following discussion, at the recent meeting of the American Associatiou for tho Advancement of Science, will be found of particular interest to the readers of the Press, as showing the present opinions of our ablest scientific authorities, and at the same time giving a summary of Sterry Hunt's more recent labors in the same field, where he has won for himself a substantial fame amongst the first scientific men of the times:

T. Sterry Hunt, of the Canadian Geological Commission, read a paper upon the "Chemico-Geological Relations of the Metals," which was followed by an interesting discussion upon tho origin of mineral veins, in which Prof. Silliman, of New Haven, and Prof. W. P. Blake, of California, took part and expressed their views at length.

Prof. Hunt said, that the distribution of the heavy metals known to us in the arts, is of much interest in a geological point of view; although much more rare than tho alkaline and earthy metals, and than many other elements, they still occur accumulated in beds and veins, either in a pure state or combined with sulphur or oxygen as rich ores. How have they been thus brought together, and what laws govern their distribution? If we go back to the *chemistry of chaos* we conclude, judging from analogy with the sun and stars, which we look upon as worlds in the process of formation, tbat the metals, like the other elements, existed in a vaporous state in the nebulous mass. During the cooling process, when the affinities of these metals for oxygeu came into play, non-volatile oxides were formed and precipitated, while the precious metals still remaiu in a gaseous state, but were at leugth precipitated on the cooling globe, which consisted of silicates of the various bases, the oxidable metals included. This silicated mass was decomposed by the subsequent acid rain precipitated from the dense hot atmosphere. The bases passed iuto solutiou, silica being separated. Wheu the latter process of subaerial decay gave rise to carbonates of alkalines and alkaline earths, these precipitated all other bases from the sea, and thus the first oceanic sediments were rich in the heavy metals. The subsequent solution of these by infiltratiug waters charged with alkaline carbonates, or silicates, or with soluble sulphides, was discussed at some length by the author, who showed that by the difference in the composition of the water, or in its temperature, it was easy to explain the more or less complete isolation of the various metals which we sometimes meet with, as where deposits of lead, or zinc, or iron are found almost exempt from other metals, by a process of natural analysis and elimination. When these impregnated waters rise through fissures which traverse the strata, the walls become lined with deposits of the various ores and spars, the conditions of whose solution and deposition were discussed. The influence of the various admixtures of waters of different compositiou coming into the fissures was noticed, and also the important relations of temperature to the solubility of tho various metallic compounds. In this connection, the author insisted upon the relations of temperature and pressure to solntion, in accordance with Sorby's discovery, that for such substances as dissolve with a diminution of volume the solvent power of the liquid increased by pressure. Hence, as solutions rise from great depths and become relieved from pressure, the excess of dissolved matter must slowly crystallize out. All of these points were illustrated during the reading of Mr. Hunt's paper, and in his remarks in the discussion that followed. He insisted on the formation, in many cases, of beds or floors of metallic ores or metalliferous rocks, formed by the overflowing of these charged mineral waters. The igneous theory of the origin of metallic veins was then discussed by some of the members present.

In the course of the discussion it was argued, that in the case of auriferous veins, the conditions in which gold has been dissolved and again deposited were evidently not unlike those of the various metallic sulphurets which very generally accompany it. Dr. Hunt considered that soluble alkaline sulphurets and carbonates have been the great agents in the solution of deposition of tho metals and metallic ores, and also of the quartz and spars which generally accompany them.

Prof. Silliman expressed his impression that metallic veins are not contemporaneous with the rocks, but that they have filled the fissures in rock formations in various directions, and that these fissures have in some sense had a growth like that of endogeneous trees. He had perceived, however, a singular dualism on the adjacent walls of the same fissure—if on the one side we find pyrites there is the same on the other side, exhibiting tho deposit as formed from a central place or axis, the spread of the walls being due to the crystallizing action demanding more space, tho width of the fissure indicating to a certain extent the length of time required for the deposit, and the amount of matter. He could not believe that most of the fissures so filled were originally formed as wide as we now find them. The walls appear to have been spread asunder by the force of crystallization of the minerals deposited in them. In the great Comstock lode, of Nevada, the width is, in some places, over 200 feet. In the gold-bearing veins most constant in tenor, the metallic sulphides are always found, as of iron, copper, and more rarely lead, with sometimes zinc and arsenic. The condition of gold in the sulphides was a vexed question. Sometimes we see the gold, but not generally, and it will not yield to amalgamation in any profitable degree; hence the process of extraction must be chemical and not mechanical—the method of chlorination after roasting being the most rational.

Mr. Bassnett, of Ottawa, asked if the Stanislaus lode, at Carson's Creek, California, did not negate, so far as itself was concerned, the proposition of Prof. Silliman.

Prof. Silliman had examined it, and found it to exhibit no evidence of igneous origin.

Dr. Blaney asked if it was supposed that tbe brilliant iron and copper pyrites found in veins are precipitated from solution?

Prof. Silliman replied in the affirmative, and thought no one could show any evidence of igneous origin in metallic veins. Ho had been a disciple of the igneous school, was brought up in it, but bis convictions had been changed after much toil in the field.

Dr. Hunt, in further support of his views, mentioned the effect of a thermal spring upon the pipes conducting it; the pipe, being bronze, was dissolved.

Dr. Blauey asked whether Dr. Hunt believed that the materials held in solution were deposited by double decomposition?

Dr. Hunt replied that there was a difficulty in stating how substances existiug in solution were deposited. Generally it was a mere question of temperature.

Prof. W. P. Blake, of California, commended the manner and matter of the paper,

marking that his observations for several ears upon the gold-bearing veins of Cali- rnia and other regions fully sustained the iew of the aqueous origin of quartz veins, id the deposition of gold and silver from iermal waters ascending along fissures. n California there were several interesting nfirmatory examples. Gold had been nnd in visible grains in semi-opal, clearly e resnlt of aqueous deposition. He would en go further than Prof. Hunt, and main- in the view that gold was even now rising the snrface in springs and depositing in appreciable quantities near or at the sur- ce either by diminution of pressure or of mperature, or by chemical decomposition nsed by contact with infiltrations from e surface or from the sides of the fissures. fine example of the formation or origin quartz veins is found in the well-knowu teamboat Springs of Nevada, where hot ater rises along a fissure for half a mile, d is depositing quartz, and possibly gold d silver. Prof. Blake believed that future emical investigation of thermal waters in ch localities, would show the presence of ld and silver, although perhaps in very nall quantities. At the celebrated Ophir ine of Nevada, from which such a flood of lver had been sent forth, there was orig- ally a spring of water at the surface, and flow of water had been found at a great pth, and that there the water is hot, and lds various salts in solution. He believed at the ascent towards the surface of ther- nl waters, as in springs, in irregnlar col- mns in greater quantity in some parts of a sure than in other parts, would account tisfactorily for the origin of what are own among miners as "chimneys" or ore-shoots," the metals in such places be- deposited where the flow was the greatest. e chemical nature of the walls or fissures ong which mineralized waters were flow- g, would necessarily greatly influence or termine the character and quantity of the tals deposited.

Prof. Stoddard asked if the veins were ther as they descend, as would follow m the law of saturation and release from essure. If this were not so, he asked, w it could be accounted for.

Prof. Blake observed that it must be kept view that few or none, perhaps, of the neral veins which have been explored, s in the exact condition in which they are rmed. They have been subjected to great gradation, erosion or denudation, so that e outcrops, as we find them, are far below e original surface reached by the mineral ters. In some cases, a thousand feet or re of veins had been swept away, thus posing to our view portions of veins that ginally were far below the surface. It s thought that the portion of gold-bear- g veins which have been swept away by e action of rivers or of glaciers, were, rhaps, richer in gold than the portions ich remain, and that thns the extreme lness of the placers as compared with e veins might be accounted for. The epest mines, however, penetrated only an ignificant distance in the veins, compared th their extent, and there was not enough servations to justify any general conclu- n regarding the increase or decrease of lness of veins from the surface down- rds.

MINING FOR TIN has not been carried on any extent in Australia, being confined the Ovens and Upper Yarra districts. e following information is from the *Morn- ton Journal*, respecting the Colin Camp- ll tin mines:

The site of the works is on Sir William llace Creek, about 50 miles from Mel- rne, and the mine was discovered about years ago, by some men engaged in ting a track to the Jordan. Two leases re taken up, and a company having a pital of £7,000 has been formed to work e mine. Mr. James Pascoe, who has en appointed manager of the workings, d is an experienced miner, reports favor- ly of the company's prospects. He states t there will be about 100,000 cubic fath- s of sand to wash. This is rich in tin o, and contains gold to some considerable ent—it is hoped and thought to be in sufficient quantity to clear the working ex- nses. About six tons of ore have already en taken out and cleaned. It is recom- nded to send the ore to England to be ted, and ultimately to erect proper smelt- furnaces, etc., on the ground. When plant is complete, the manager can, he oks, produce the grain tin fit for the rket at 70s. to 80s. per ton of ore, and so e considerably in cartage. The present rkings are entirely for stream tin, but it confidently expected that the lodes from ich it has been derived will be discovered ring the workings.

Mechanical.

ELASTIC COUPLING FOR ROPES OR CHAINS. Messrs. William Dixon and William Brown, of Newcastle-on-Tyne, engineers, have patented "an elastic coupling for the prevention of sudden or unfair strains upon ropes or chains when used in towing, hauling, or lifting." It is also particularly adapted for use in mines and collieries where the ropes or chains used in winding up the cages or tubs are subject to a sudden strain at the commencement of the lift. The apparatus consists of a wrought iron frame of a suitable shape, in which is placed one or more drums keyed fast on to a shaft or spindle, so as to revolve with it. To this spindle or shaft are attached spiral springs in such a manner that when the drums are made to revolve, the springs are thereby compressed. A smaller frame is fitted loosely within the main frame, and has attached to it the hook by which the rope or chain to be used for drawing or lifting can be fastened. This smaller frame carries one or more smaller drums or sheaves. Ropes or chains of a snitable length are fastened to the large drum or drnms, and wound three or more times round them, then led over the smaller drums or sheaves, and then secured to the top shackle of the main frame. If any sudden strain comes upon the hook on the smaller frame, it will cause the large drum or drums to unwind, and thus act on the spiral springs; by this means the ropes or chains used will be relieved of the sudden shock to which they would be otherwise subject.— *Colliery Guardian.*

REVERSIBLE PLOW.—At a recent meeting of the Farmers' Club of the American Institute, a reversible plow called the "Victory," manufactured by C. W. Sykes, of Suffield, Connecticut, was shown, which, unlike the ordinary reversible plow, is designed for work on level land. The distinguishing feature of this plow consists in two mold-boards with suitable shares so arranged that they may be used alternately when plowing in opposite directions at the same side of the field, one being carried at the top of the plow while the other is in use, and the reversing movement being obtained by a kind of toggle-joint, which also serves to brace the parts in position. One or two gentlemen stated that they had witnessed the operation of this plow, and that its work compared very favorably with that of others used in the same field.

BRIDGE BUILDING was one of the arts brought to the greatest state of perfection during the rebellion. General McCallum states that the Rappahannock River bridge, 625 feet long and 35 feet high, was rebuilt in nineteen working hours; Potomac Creek bridge, 414 feet long and 82 feet high, in forty working hours; Chattahoochee bridge, 780 feet long and 92 feet high, in four and a half days; that between Tunnel Hill and Reseca, 25 miles of permanent way and 230 feet of bridges were constructed in seven and a half days, and near Big Shanty 35¼ miles of permanent way and 455 feet of bridges in thirteen days.

WOODEN PARASOLS.—A Parisian invention, now being introduced in London, is a wooden parasol. They are painted to represent peacock's feathers, each feather being a separate rib, like those of a fan. By ingenious mechanism they can be fastened into the form of a parasol, and can also be folded up into as small a compass as a fan, which purpose they answer admirably. They can also be turned into a variety of things, and have joints by which they shade the wearer on any side where the sun is too powerful.

THE wire of a telegraph line just put up between Dover, N. H., and Lake Winnipiseogee, is made of a steel core surrounded by copper. By this construction, it is claimed the following advantages are secured: Superior conducting power, with less weight of metal, durability, and a less number of poles on the line.

A TRIAL of Col. Berdan's new breech-loading rifle was made at the armory grounds, Springfield, satisfactorily to himself and friends. The trial was made at distances varying from 300 to 1,050 yards; in the former case the mean deviation being three inches, and in the latter twenty inches. The gun is upon the sliding-bolt principle, and resembles the Chassepot gun with which the French troops are armed. Col. Berdan has orders from the Russian, English, and Austrian Governments.

Scientific Miscellany.

THE SPECTROSCOPE AND THE BESSEMER PROCESS.—Almost with the first announcement of the action and indications of the spectroscope, says the *Journal of the Franklin Institute* for July, it was proposed to apply it in the manufacture of iron as an indicator of the progress in change or conversion of the material. After many and various experiments, which we have from time to time noticed, it is now at last announced that a satisfactory result has been reached by Prof. Lielegg and Dr. Roscoe, and that in the Bessemer process, the proper moment for stopping off the blast and introducing the spiegeleisen can be determined by observation of the flame escaping from the converter, with a spectroscope. The order of changes in the spectrum are from first to last as follows: When the charge is started, a luminous spectrum appears, due to the volley of sparks, with no lines; soon after the sodium line is seen, followed by those of iron, lithium, potassium, hydrogen, nitrogen, and a number of bright lines with very dark spaces between, due perhaps to carbonic oxide and perhaps to carbon vapor, which occur principally in the green, these again disappear in inverse order to that of their development, and their total or partial extinction is the signal for the stoppage of the blast, and the introduction of spiegeleisen.

POTASH FROM WOOL.—The French have discovered that sheep draw from the land on which they graze a considerable quantity of potash, much of which is ultimately excreted from the skin with the sweat. It was pointed out by Chevreul that this peculiar potash compound *(suint)* forms no less that one-third of the weight of raw merino wool, while of ordinary wools it constitutes about fifteen per cent. of the weight of the fresh fleece. As the *suint* may be extracted by mere immersion in cold water, it is easy for the wool manufacturers to produce more or less concentrated solutions from which the potash may he recovered by appropriate treatment. The development of the new industry is principally due to MM. Maumené and Rogelet, and their process is probably in operation at most of the great seats of wool manufacture in France. The plan adopted is very simple. They evaporate the solutions which are sent to them until a perfectly dry and somewhat charred residue has been obtained. This is placed in retorts and distilled, very much in the same manner that coal is distilled at gas works; and the result is that, while much gas is evolved, which can he used for illuminating the factory, and much ammonia is expelled, which can he collected and utilized in many ways, here remains a residue which chiefly consists of carbonate, sulphate, and chloride of potassium. These three salts are separated hy the usual method and then pass into commerce.

NEW METHOD OF EXTRACTING COPPER.—Mr. Wm. Henderson, of Glasgow, has taken out a patent for a process for working poor copper ores. His claim is for so regulating and mixing his ores that the proportion between the copper to he extracted and the sulphur combined with it shall be at all times constant. In the preliminary calcination of the pyrites he makes such an admixture as shall leave him in the hurnt ore from one to one and a half times as much sulphur as the metal to be extracted; thus, if the pyrites have two per cent. copper it must have three per cent. sulphur, and so on for other percentages. In the further treatment of this prepared ore, from ten to twenty per cent. of salt is mixed with it, and the mass is then calcined in close calcining and volatile chlorides. The former are washed out of the ore and the latter caught in a condenser filled with coke. Mr. Henderson states that the main feature of his process, and the one which has established its practical success, is the regulation of the proportion of sulphur to that of the copper in the ore as one and a half to one as a maximum. In this proportion the mutual decomposition of the salt and sulphuret of copper takes place so rapidly and so completely that calcination is effected in six hours, and can be conducted at a dull red heat.

MR. HUGGINS has succeeded in showing that Sirius—the only fixed star that he has had time to examine satisfactorily—is approaching the solar system at the rate of 29½ miles per secoud.

MR. BROWNING has observed several faint markings on the planet Venus resembling the grey plains on the moon. These markings seem to be studded with white spots of various sizes.

SPONTANEOUS COMBUSTION.—On Sunday evening, July 20, the outer wall of the new fire-proof building of the iron and steel works in Derby, Ct., was observed to radiate a strong degree of heat. It was subsequently discovered that a deposit of iron turnings or chips, amounting to several tons, in which was a considerable mixture of oil, had ignited by spontaneous combustion. Workmen with wheelbarrows immediately began removing the deposit, which occupied ten or twelve men from seven o'clock Sunday evening, till noon on Monday. The heart of the pile was found a mass of fire, and but for the brick work, and the prompt action in subduing the fire, quite a conflagration might have been the result. A few years ago the dross and excrescence from the furnaces of this company, together with iron filings, sawdust mixed with oil, etc., were deposited on a portion of its grounds in large quantities, covering nearly half an acre to the depth of eight feet, designed to form a plateau or grade. This mass took fire in the fall of that year and resisted all attempts at extinguishing until nearly spring, the whole mass seething though smoldering, and at times bursting out with extreme heat and a vigorous draft of flame. If apparently subdued with a copious flow of water it would soon reappear in another quarter, and finally had to he subdued hy trenching.

At the Churprinz galena mine, in Saxony, there is a warm spring caused by the heat evolved from the decomposition of iron pyrites. Heat is caused by a rapid combination of the oxygen of the air with the substances in question; when evolving appreciable heat or light, it is called "burning."

MEERSCHAUM FROM POTATOES.—Chemistry has discovered a new and interesting use for potatoes and other vegetables, illustrations of which were seen hy visitors at the Paris International Exhibition. If potatoes are peeled, macerated for about thirty-six hours in water, to which about eight per cent. of sulphuric acid has been added, well washed with water, dried in blotting paper, and then in hot sand for several days, on plates of chalk or plaster of Paris, which are changed daily, being compressed at the same time, an excellent imitation of meerschaum, answering well for the carver or any purpose not requiring a high temperature, will be obtained. Greater hardness, whiteness and elasticity will he produced if water containing three per cent. of soda, instead of eight per cent. of sulphuric acid, is used; and if, after the potatoes have been macerated in this solution (soda), they are boiled in a solution containing nineteen per cent. soda, a substance resembling stag's horn, and which may be used for knife handles, etc., will be formed. Turnips may he used instead.

AN ELECTRICAL ORGAN was recently inaugurated in the Church of St. Augustine, Paris. A single wire passing from the key to an electro magnet communicates to it a galvanic current, thus obviating the old system of the long chain of wooden slips, called trackers, that required such hard thumping to cause them to move promptly. This electro magnet, by means of a small valve, works the pneumatic lever, which consists of a sort of bellows placed just under the wind-valve of the pipe.

TO REMOVE paint of white lead or zinc, if it resists the action of benzine, ether, or bisulphide of copper, as it may if the paint spots have become hard, use a small amount of chloroform.

WATER-PROOF GLUE, says the *Journal of Applied Chemistry*, may be made hy boiling one pound of glue with two quarts of skimmed milk. This makes an excellent glue for articles which are exposed to the action of the weather.

THE North German expedition for the observance of the solar eclipse of the 18th August, started from Berlin on the 8th July for Bombay.

THE coal strike in Pennsylvania having ended, mining operations have been resumed with great activity under the stimulus of increased prices for coal. The effort of the miners to enforce their interpretation of the eight-hour law, and to obtain for eight hours' labor the wages previously given for ten, was a total failure except at a very few collieries. In returning to work under the ten-hour system, in the Schuylkill region, they secured an advance of from ten to fifteen per cent. on their old wages.

Papers Read Before the Scientific Association.

From the daily programme of the seventeenth meeting of the A. A. A. S., recently held at Chicago (sent to us by Prof. Blake), it appears that papers were read on the following subjects.

Geology, as will be observed, has employed a large proportion of the best talent of the country; an unusual amount of activity and originality being exhibited in the observations which have been made, and in the papers that were read, pertaining to the earth's physical history. Thus an American school of geologists is seen growing up under the instruction of our own peculiar physical surroundings, whose progress and influence,—with Dana at the head,—will soon stand not second to that of any of the publicly more favored European countries. Boldness in the advancement of new principles and theories, is characteristic of the matter presented. Hence the utility of such public discussions—the immediate result of the same being the creation of an enlightened public opinion upon scientific subjects, and the killing off of humbugs,—a sore necessity on every new and prolific soil:

By J. H. Gibbon, on the artistic evidences of the remote colonization of the Northwestern or American continent by maritime people of different nationalities before the modern era; by Rush Emery, on a boulder field in Cedar County, Iowa; by N. T. True, on phases of glacial action in Maine, at the close of the drift period; by Henry Wurtz, giving supplementary notes on gold genesis; do., containing some new facts and views concerning aluminum; upon the Ammonoosac gold field in New Hampshire; on a suspected unknown element in the Laurentian magnetites; on the nature of metallicity; studies of the red sandstones of the Atlantic slopes and their inclosed igneous masses; on chemical geogomy, in three parts: 1st.—on the prozoic atmosphere and the ocean of the zoic dawn; 2d.—Zoic history from a chemical view-point; 3d.—chemical revelations of the final zoic catastrophe; by T. Sterry Hunt, on the chemico geological revelations of the metals; by Elias Loomis, on the influence of the moon upon the weather; by T. S. Hunt, on gold in the Laurentian rocks of Canada; do. on the gold region of Nova Scotia; by J. W. Foster, on the origin of the prairies; by C. C. Parry, on the habitable features of the North American continental plateau near the line of 35° north latitude, containing a general summary of conclusions derived from a review of its aboriginal population and natural features; by J. D. Whitney, on the progress and present condition of the Geolgical Survey of California; by Edward Hungerford, notice of experiments on snow and ice at a temperature below 32° F.; by O. N. Stoddard, on the hot term of July; by T. S. Hunt, on the upper Silurian and Devonian rocks of Ontario; by W. P. Blake, on the plasticity of rocks and the origin of the structure of the so-called gravestone slates of California; by J. S. Newberry, on the physical geography of the continent of North America during the different geological periods; by A. H. Worthen, on the fuel resources of Illinois; by J. W. Foster, on the antiquity of man in North America; do. on crania of Boothcrinm and Castoroides, with remarks on their geological position and their living analogues; on the refrigeration of continents; on the occurrence of tin in Missouri; by L. H. Morgan, on the migrations of the Indian family; by E. L. Buttrick, on the application of carbonic acid gas in the extinguishment of fire; by J. H. Coffin, on Hough's barometrograph as applied to the investigation of the storm curve; by James Hyatt, movements in stratified rocks since the glacial epoch; by Charles Whittlesay, on the stratigraphical relations of the fossil horse in the United States; do. on the geological evidences of man's antiquity in the United States; by J. S. Grimes, on the laws of ocean currents; by P. E. Trastour, on new geological studies, and laws of the earth; by S. D. Tilman, on the combining power of chemical elements; by Edward Hungerford, on experiments illustrating the flow of glaciers; by T. C. Hilgard, on the importance of the sub-marine Aleutian chain as a geostatic and geographical feature; by H. F. Walling, on atomic motion; by C. A. White, on the red quartzite boulders and their original ledges *in situ* in northwestern Iowa, eastern Dakotah, and southwestern Minnesota; by F. B. Hough, on the principles of statistics as applied to the census; by A. Winchell, exhibition of a new geological chart, and a new label holder for geological specimens; do. on some points in geological nomenclature; by Thomas Egleston, on the profiles of blast furnaces; by J. S. Newberry, on the physical geography of the continent of North America during different geological periods; do. on the transportation of materials forming the carboniferous conglomerates; and on the surface geology of the basin of the great lakes and the upper Mississippi Valley; by W. P. Blake, on the gradual dessication of the western portion of North America; do. on vestiges of pre-historic races in California; by S. K. Warren, on certain physical features of the Mississippi River; by G. L. Vase, on the distortion of pebbles in conglomerate at Ranghy, Maine; by Theodore Gill, on the classification and relations of seals; by A. Winchell, on the secular recurrence of identical petrogenetic conditions; by J. S. Jewell, on superficial geology of the lake shore near Chicago; by Charles Moran, on the Darwinian theory of development; by George A. Leakin, on the periodic law in the failure of harvests and inundations, with suggestions as to their insurance; by J. S. Wallace, on the old lake beds of the prairie region; by J. D. Whitney, on the fossil skull of Calaveras County; do. some points in the surface geology of the western side of the American Continent; and in the Yosemite Valley; by Benj. Silliman, on the structure and aqueons origin of gold-bearing mineral veins; do. on methods of amalgamation in the treatment of gold ores; and on the occurrence of the mastodon in the deep-lying gold placers of California; by P. H. Vander Weyde, on the relation between the atomic volume of different metals, and their paramagnetic and diamagnetic properties; by W. W. Williams, on geodes; by T. H. Safford, on the theory of the prediction of star places; by J. S. Newberry, on the oldest known fossil trees, from Devonian rocks in Ohio; by Michael W. McDermott, on the application of the heliostat and method of running true meridian lines in surveying; by W. DeHass, on the archæology and ethnology of Mississippi Valley; by B. Silliman, on the evaporative power of the sun near the base of the Sierra Nevada, in Calaveras County, California; by Clinton Roosevelt, proofs that the changes of climate and dislocations and upheavals of the earth's strata, are due to astronomical and not to glacial action; do. on the beginning of creation, of the sun and planets, with strictures on the cosmogonies of Des Cartes, Kart and La Place; by James Hyatt, glaciers as extensive and constant geologic agencies; do. some points in the geology of Hudson River; by W. P. Blake, on some of the causes which affect the rapidity of the erosion of rocks and river valleys; by B. W. Hawkins, on the interpretation of fossils; by S. F. Peckham, notes on the origin of bitumens, together with experiments upon the formation of asphaltum; by O. N. Stoddard, on the higher law of correlation; by E. W. Hilgard, on the geology of the Mississippi delta and the salt deposit of *Petite Anse*.

It is presumed that all these papers will be published and procurable through the members.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Mexican Mining Co.—State of Nevada. Sept. 22d Capital stock, $500,000. Trustees: Mark and Frank Livingston, G. W. Beaver, John Gillig and Chas. Bonner.

Alexander Mining Co.—State of Nevada. Sept. 25th. Capital stock, $400,000. Trustees: W. Lane Booker, J. O'Hara Taaffe, R. G. Sneath, D. W. C. Rice and Jno. T. Boyd.

Star Creek Mining Co.—Humboldt county, Nev. Sept. 30th. Capital stock, $500,000. Trustees: Irwin Davis, George Falkener, J. Livingston, Horace Morrison and S. H. Morrison.

Kansas Gravel Mining Co.—California. Oct. 2d. Capital stock, $300,000; 3,000 shares. $100 each. Trustees: E. J. Weeks, R. E. Brewster and James T. Boyd.

A Gold Quartz Vein has been discovered near Clinton, N. Y., assaying $15.45 to the ton in gold, and about twenty per cent of that amount in silver.

A Spectacle Worth Seeing—The continual crowd at Maller's Spectacle Emporium, 205 Montgomery. *

Prepared Solder.—One of the new labor-saving preparations for which our Eastern States are famous, is that of Wilson's Prepared Solder, by the use of which the old-fashioned soldering iron is dispensed with in the mending of

small wares, about the household. The accompanying cut shows the application. The apparatus is simply a small vial of acid, with a wire of solder, which, when not in use, is coiled about the neck of the vial. The directions for use best explains its simplicity. The agency for the Pacific coast is at No. 31 Kearny street.

A Successful California Invention.—W. C. Bussey's Improved Combination Bank and Safe Lock, which received a diploma at the late Mechanics' Fair, is a California invention of no ordinary merit. It is also an article of home manufacture, being built by the inventor at 18 Post street, in this city.

This is a lock in which a series of tumblers is employed, and it consists of a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely strong, simple and effective lock is obtained, presenting an almost unlimited number of combinations. In his improved lock the bolt is drawn by means of the center knob, whereas in the original it is drawn with an eccentric hook. In the latter form it received a special premium at the State Fair in 1867.

It has already been extensively introduced in this city, as well as in many portions of the interior of California and Oregon, usually giving the best satisfaction, and in many instances receiving from parties using the same very complimentary certificates as to general excellence and superiority over other similar locks in use.

The Bank of British Columbia was the first to order one of these locks. This was not done without mature deliberation and a strict investigation of its merits in comparison with some of the most noted and popular old styles of combination locks. They afterwards recommended it to the attention of the public, believing it to possess all the advantages claimed for it by the inventor.

Of the many good things they say of it, we append the following: "It is strong in construction without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable."

It is capable, we understand, of making over half a million different changes. It will be found impossible to open this lock by manipulating the combinations without a knowledge of the numbers on which it is set. It is also entirely keyless, with no signs, letters or figures, nor even a keyhole on its face to tempt the wily burglar.

Ore Concentrator.—The *Artizan* records a new invention in concentration, consisting of "an ore bed composed of tubes constructed and arranged so as to admit of the passage within and through or out of them of a current or currents of air or water in such manner as that said air or water in escaping therefrom will meet in the center or cross the opening or openings in the bed through which the ore or certain grades of it descend or pass in being separated." The ore bed is made of tubes or hollow bars of a reticulated character for the passage of air or water through them. The heavy particles of ore fall through the opening or openings in the bed; a free action of air or water is secured on the ore lying on the bed, and at the same time an unrestricted and convenient escape for the concentrated or rich ore is established. The improvement is applicable to ore concentrators or separators generally. S. R. Krom, of New York City, is the patentee.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week Ending September 16th, 1868.

82,058.—Improvement in Mortising Chisel.—Otis Adams and James Hatch, of San Francisco, Cal.:

We claim making the lips beveled from the edge to the main part of the chisel and with the ends beveled and inclined as herein set forth.

82,122.—Improved Composition for Marking Designs upon Fabrics.—Mrs. R. L. Jones, Sacramento, Cal. (Antedated May 6th, 1868.)

I claim the composition of resin and soot perfumed, as above described and for the purpose set forth.

82,135.—Improvement in Device for Conducting Grain to Threshing Machines. A. W. Lockhart, Sacramento, Cal.:

I claim the employment or use of a plurality of endless aprons H, K, K, connected with a frame F, and an adjustable upright pole A, and all arranged in such a manner that the aprons may be adjusted at different degrees of inclination in order to feed grain from stacks or wagons to threshing machines, and the pole rendered capable of always being adjusted in a vertical position, even when placed on uneven or inclined ground, substantially as and for the purpose herein set forth.

82,065.—Improvement in Gang Plow.—Fredcrick P. Smith, Petaluma, Cal.:

1. I claim the arrangement of the devices and means herein recited for raising and lowering the frame and plows.

2. The bars with spaces on the end of the beam and on the tongue, with the bolts and nuts, for the adjustment of the land wheel axle, and the caster wheel arm, as herein set forth.

82,166.—Improvement in Gang Plows.—F. P. Smith, Petaluma, Cal.:

I claim the combination of the several means and devices herein set forth for raising and lowering the plows.

Recent Inventions.

New System of Constructing Railway Tracks.—Among the recently granted patents by the United States Patent Office, is one to Carlo Margutti, of Milan, for a new locomotive and a new system of constructing railway tracks. A new area would be marked in the history of Italy if she should substitute or supplement her ascendency in art and music by instructing and leading the world in mechanism.

Notices of Recent Inventions.

81,910.—Improvement in Escapements.—Wm. C. Kellum, San Francisco, Cal.:

1. I claim the detent F, and the adjusting screw d, together with the curved arm H, and the spring I, operating by the liberating pin a, or its equivalents locking by spring or gravitation, substantially as and for the purpose described.

2. The escape wheel B, moving in a plane parallel to that of the balance staff and of the plates A, A, and giving impulse to the pallet c, either from the sides or point of the teeth, in combination with the detent F, arm H, and spring I, substantially as described.

3. The balance staff c, standing parallel with the plate A, and the liberating pin a, passing alternately above and below the lip J, at each vibration, substantially as described.

In this invention the balance receives one impulse at each vibration, the detent being operated by a liberating pin attached to the balance staff, and moving alternately above and below a lifting spring, which operates the detent. By this and other improvements difficult of description, it is claimed that the movement of the piece is rendered more accurate than in the ordinary clocks, the balance wheel receiving its impulse at each vibration, while the arrangement of the several moving parts is such that the piece is rendered simple and cheap.

Two Rocks, Sonoma Co., Cal., Sept. 23, 1868.—Messrs. Dewey & Co.—On my arrival home, I found my Letters Patent all arranged to my entire satisfaction. Please accept my thanks for the energy, skill and dispatch with which you procured it for me. In future, should I require assistance in your line of business, I shall most certainly apply to you. Truly yours,

Michael Laufenburge.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, October 3, 1868.

City Stocks.

More than usual activity characterized the miscellaneous share market during the week under review. Sales of San Francisco Gas stock were made at $77 50. The usual monthly dividend is payable since the first instant. Considerable sales of Spring Valley Water stock have been effected at $66 per share. California Steam Navigation sold at 68½ @ 68 per cent.; North Beach and Mission Railroad at $70, and National Insurance at $73.

The Pacific Bank paid its usual monthly dividend on the first instant. The annual meeting of the stockholders of the Home Mutual Insurance Company will take place on Tuesday, the 6th instant, at noon.

From our carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following interesting figures, for the first nine months in 1865, 1866, 1867 and 1868:

MONTH.	1865.	1866.	1867.	1868.
January....	$1,001,598	$2,727,187	$3,664,322	$8,688,934
February...	2,356,855	3,152,292	3,303,520	9,716,396
March.....	5,528,900	5,220,064	4,034,259	11,471,830
April.....	4,330,622	4,038,896	5,593,016	12,385,304
May.....	5,865,549	3,052,102	7,671,855	10,162,336
June.....	4,571,640	2,408,341	6,864,365	9,058 063
July.....	4,721,193	1,553,854	6,822,200	8,474,898
August.....	4,292,618	1,284,452	7,538,420	11,312,001
September..	4,829,501	1,758,191	6,130,854	10,578,561
Totals.....	$38,498,866	$25,871,619	$51,667,841	$92,178,083

It will be observed that the sales for the period under review are largely in excess of like periods since 1865, being nearly four times larger than 1866 and twice as large as the sales in 1867. The transactions at the open sessions are included in the above statement, and amounted to $1,654,625 in January, $2,138,763 in February, $2,676,558 in March, $2,533,474 in April, $2,112,940 in May, $2,132,086 in June, $2,013,694 in July, $2,918,472 in August, and $2,883,657 in September, making a total of $21,283,886 for the past nine months.

Mining Share Market.

Viewed as a whole, the reports from the State of Nevada during the past quarter have been satisfactory for the present, and encouraging for the future; the older mines having continued to yield about their ordinary complement of bullion, and liberal shipments having been made from many of the outside districts. Although the various claims on the Comstock vein have scarcely aggregated so large a product of the precious metals as usual, exploratory labors have been pushed upon the most of them with great energy, resulting in some cases in the development of fine bodies of ore in the lower levels of the mines, and at greater depths than had before been reached. In a few cases no such results have been arrived at; yet, as the vein has been found every where preserved in all its masterly proportions, no serious apprehensions are entertained as to the finding of fresh bodies of pay ore at points further down. The history of all great mines, and even that of the Comstock lode itself, teaches that a continuous mass of high grade ores is not to be looked for. Hence the occurrence of these barren spaces should create neither surprise nor alarm, being what is encountered in the experience of silver mining all over the world. It may be accepted as a geological axiom, that so long as the vein itself exists it is almost sure to carry these bunches of ore indefinitely downwards. We explained on a former occasion the theory of the occurrence of these bonanzas or chimneys in all powerful veins, from which it was made to appear that no individual claim along the line of a great lode would be likely to be always in rich ore; and further hermore, that there was no well authenticated instance of any such vein having ceased to yield valuable ores so long as its continuity was maintained. The silver mines of Mexico, after more than three centuries of active, and probably many more of moderate development, afford no signs of final exhaustion; while those worked to much greater depths, in other parts of the world, than have ever yet been attained on the Comstock lode, continue, as a general thing to yield as well now as at any previous time.

The present depressed and fluctuating condition of the share market can hardly be accepted as indicating the actual or prospective condition of these mines, nor even as being a fair exponent of opinion in regard to the same. As is well known, the prices of these stocks are often very little dependent on the product or appearance of the properties they represent, it having sometimes happened that they ruled lowest when the mines themselves were looking well and yielding largely. Even now, as before remarked, several companies have reached what seem large bodies of good ore at unwonted depths, a number of the more prominent and largely productive mines appearing in this category. Thus in the north Savage ground at a perpendicular depth of over 900 feet, a streak of ore 18 feet wide has been struck, which, without much assaying, it is believed will yield at least one hundred and some of it several hundred dollars to the ton. Lying at such a great depth, this discovery may be considered significant of developments likely to occur at simi ar depths elsewhere on the great mother lode. The Yellow Jacket company in their lower levels, and the Alpha between their 200 and 300-foot levels, have each a large mass of medium grade ore; and although the Imperial and Crown Point companies have not as yet reached in their deepest levels such deposits as they were seeking for, both are raising considerable quantities of fair milling ores, the same being the case with the Chollar-Potosi and several other leading companies.

Some difficulty has been experienced of late in maintaining a proper degree of ventilation in several of the Comstock mines, leading to a suspension of work upon them for a season, curtailing to that extent the ordinary ore supply; while an unusual number of mills in that vicinity have been stopped for enlargement or repairs, thereby diminishing the amount of bullion that would otherwise have been produced.

Although we have admitted there may have been a slight falling off in the product of the Comstock mines thus far for the current year, it is not clearly apparent that such is the case. That the aggregate amount of the precious metals sent from Nevada the present, will equal, if it do not exceed that of any former year, seems probable; but as much of this comes from outside districts to Virginia City and is there re-shipped and credited to the Comstock lode, it is difficult to discriminate between what actually belongs to the Virginia mines and what to those located elsewhere. But whether the aggregate yield of the Comstock mines may have been a little more or a little less this year than last, it is not material to inquire, since it is certain that by the construction or a railroad reaching from Virginia City to the Truckee, their annual production might for many years be doubled simply by working the refuse ores that have accumulated about those mines and the low grade ores that exist near by in great profusion. With such facilities for cheap transportation, it is believed that $7 ore could be reduced with profit—a class that could be procured, if not from the Comstock lode, at least in the vicinity of Virginia, in untold millions of tons. Thousands upon thousands of tons of tails and even a higher grade ore lie heaped up about the dumping grounds at Virginia City and Gold Hill, or are buried in the chambers of the old mines where they were used for filling in or thrown, simply to get them out of the way. How large the resultant gains through the construction of a railroad would become for the entire stretch of mines on the Comstock range, may be conjectured from the fact that the President of the Savage company—a man thoroughly conversant with the subject and singularly cautious in his estimates and statements—computes the annual saving that would accrue through railroad transportation to that company alone at over two hundred thousand dollars. That an aggregate saving of a million dollars or more might thus be effected seems certain. With a railroad and a deep drain tunnel constructed, there can be no doubt but the annual returns from the Comstock lode proper, instead of diminishing, will undergo a marked increase hereafter, to say nothing of the product that may reasonably be counted upon from the outside mines in the neighborhood, some of which are already yielding handsome complements of bullion.

The market for mining shares exhibited increased firmness since our last similar reference, and the general list of stocks commands greatly improved prices. The sales have also been largely augmented, showing that outside dealers manifest a greater interest than for some time past. Under the present very sharp advance "shorts" have evidently operated to a disadvantage, being the reverse of transactions made when shares were declining. The "strike" in the Savage has had this marked effect in values, and fully proves what we now, and heretofore so frequently, stated in regard to this lode.

IMPERIAL—advanced from $105 to $116, and at the close realized $113 50. The receipts of bullion for September account to the 28th amounted to $34,300. On the 29th ult. the shaft was 82 feet in depth below the 900 level, and the main drift on the lower level had attained a distance of 345 feet from the shaft, leaving 35 feet to reach the upper end of the winze on the 700 level of the Alta mine, where they now have a fair body of ore. They hoist about 140 tons of ore per day.

KENTUCK—declined from $299 to $280, advanced to $300, and closed at $295. The receipts of bullion so far for September account aggregate $105,695.....CONFIDENCE, to the 26th September, produced $18,271 84 for account of that month.....GOLD HILL QUARTZ received $8,395 so far for September account.

SAVAGE—was exceedingly active toward the close of the week, at a very material advance, rising from $93 to $125, and closing at $117. This company has been successful in reaching a fine body of ore on the lower levels of the north mine, to which we have made allusion in our opening remarks of this circular.

GOULD & CURRY—improved from $90 to $108, and closed at $109. Sinking of the Bonner shaft is much easier. The finding of ore in the Savage ground at their lowest level added the present rise of this stock... .CHOLLAR-POTOSI advanced from $147 50 to $168, and closed at $162 50. They extracted 986 tons during the week ending September 25th, against 849 tons the previous week. The southeast face of the Blue Wing stope is yielding a better quality of ore. The incline is now 74 feet below the 1,100 level.

HALE & NORCROSS—sold to a considerable extent within a range of $49@54, closing at $51. Nothing of importance from this mine. It is believed that an assessment will soon be levied by this company.....OPHIR met with trifling sales at $18 50. The shaft is now 475 feet in depth.

CROWN POINT—was in the market at $44@50, and closed at $48 75. On the 2d inst. the shaft was 98 feet in depth below the 900 level. They are getting some fair ore in the drift from the bottom of the north winze on track floor of 900 level. The stopes between the 700 and 800 levels are weakening, but will yield a sufficient quantity to keep the mill running for some weeks.....OVERMAN advanced from $79 to $90, and closed at $84 50. On the 25th of September, in the south drift on the 400 level, they met with very good ore, and a drift has been started to cross-cut the vein. The ore extracted from the 300 level shows some improvement in quality.

AMADOR—sold at $240@232 50. The bullion returns for September aggregate $42,300, against $44,250 in August. The last clean-up of the above returns aggregated $17,800. The three mills of this company did not run full time during the last half of the month.....ALTA rose from $44 to $58 50. A correspondent writes that they have found some new pay ore, 45 feet west of the east wall. The strata is narrow, but very good, and what is very strange lies entirely north.... YELLOW JACKET sold largely at extremely fluctuating rates, ranging from $1,250 to $1,455. It is reported that the lower levels show a marked improvement.....The stockholders of the LADY BRYAN Co. are requested to meet at the office in Virginia City on the fifth of October, "for the purpose of expelling all the Trustees of said company and electing their successors; and the undersigned, representing four thousand three hundred and thirty-one shares of the stock of said company, do hereby call a meeting of said stockholders, at the time and place and for the purposes aforesaid. H. H. Flagg, A. E. Hill."....A special meeting of the DANEY M. Co. will be held on the 19th instant, to amend the By-Laws.

MANUFACTURE OF SHODDY.—Not the least important of the English manufacturing towns is Batley, the seat of the great latter-day staple of shoddy. This is the famous rag capitol, whither every beggar in Europe sends his cast off gentility of moth-eaten coats, frowzy jackets, worn-out linen, offensive cotton, and old worsted stockings; this is their last destination. Reduced to filaments and greasy pulp by mighty toothed cylinders, the fabrics reenter life in brilliant forms, from solid pilot cloths to silky mohairs and glossiest tweed. Thus the tail-coat rejected by the Irish peasant, the gabardine too fine for the Polish beggar, are turned again to shiny noses, reappearing, it may be, in the lustrous paletot of the sporting dandy, the delicate riding-habit of the Belgravian belle, or the sleek garment of the confessor.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Oct. 2, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

		Per ton.			Per ton.
12 per cent. ore.....	$16 00	22 per cent. ore.....	$43 56
13 " "	18 02	23 " "	46 45
14 " "	20 20	24 " "	49 33
15 " "	23 35	25 " "	52 22
16 " "	26 20	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

A. T. DEWEY. W. B. EWER.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 414 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, miner, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its SEVENTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend the* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the PRESS and Patent Circulars sent free.

DEWEY & CO.,

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

Patent Agents, Publishers and Job Printers, 505 Clay st.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Sept. 19th: From one of the principal stockholders and managers of the Rippon mine, just up from San Francisco, we learn that the ore from the ledge recently struck, assays from $14 to over $100 per ton, and that a number of tests made, show that it will work from $25 to $50 per ton. The last three feet in the ledge shows a decided improvement in the quality of the ore.

Amador County.

Mokelumne Hill *Chronicle*, Sept. 19th: Amador County is to rank as one of the best of our mining counties. Ione Valley is producing good coal, and the Newton Copper Co. have erected smelting works, and the Cosumnes Co. have also.

Calaveras *Chronicle*, Sept. 26th: After a week's run of the mill on the Petticoat mine at Railroad Flat, 75 ozs. of gold was taken from the outside plates alone. The battery has not been cleaned up, but the yield must be enormous if there is the usual disparity between the amounts generally taken from the outside and inside plates. When the fact that the mill has only been in operation a week, and that the battery is composed of but 10 stamps, is taken into consideration, some idea of the richness of the rock can be formed. The rock crushed during the month of August paid from $125 to $150 per ton. The ore now being crushed must be of even a higher grade.

Dispatch, Sept. 26th: The prospects of the Bostwick claim, on what is supposed to be an extension of the Coney & Bigelow lead, are flattering. A vein has been found from 10 to 20 ft. in width, within 15 ft. of the surface, and it is thought that if sufficient capital could be had to open the mine thoroughly, it would prove as valuable as the famous Coney mine.

A new mine is being opened, on the south extension of the Badger mine, near Sutter Creek, in this county, by Mr. Hall McAllister, of San Francisco, under the supervision of Mr. Allen Tibbets, and the rock taken therefrom is the same quality as that of the Badger, and there is every indication that it will prove fully as rich when the mine is fairly opened.

Inyo County.

The Virginia *Enterprise* of Sept. 25th, says: Henry Schoeneman who has just returned from a prospecting expedition to the mines of Cerro Gordo district and wilderness beyond, says: The Cerro Gordo mines are yielding as rich ores as at their first discovery, not only from the surface of the various veins, but at the greatest depths yet attained on any of them by the sinking of shafts or driving of tunnels. The miners now there being men who have but little ready money, the development of the leads of the country is necessarily slow, as they are unable to purchase machinery or hire laborers. They have unbounded faith in their mines, however, and are doing their own work. They have completed an excellent road from Owen's Lake to their mines, and have erected one good furnace—a furnace capable of smelting 10 tons of ore per day. This, if not a first-class furnace, is yet a great improvement upon the primitive little furnaces at first erected and still in use among the Mexicans in the district. A large bed of excellent fire-clay has been discovered near the mines. Mr. Shoeneman brings with him some extraordinarily rich specimens of silver ore; also of lead and other ores.

Los Angeles County.

Los Angeles *News*, Sept. 25th: There are about 300 men at Soledad, some of whom are running tunnels, some sinking shafts, some working arastras and some prospecting for new lodes. In the Eureka mine, they are 67 ft. down, and have run a tunnel on the vein 90 ft. The vein is 4½ ft. wide, and pays with arastras from $35 to $75 per ton. There are 14 arastras running from rock taken out of this lode, and the rock averages $45 per ton. The owners leased the sinking and drifting on the Eureka to some Mexicans, giving them all the rock they might take out in the shaft and tunnel, which is seven ft. high by five ft. wide, and the Mexicans were satisfied with their bargain. It is the intention of the owners to sink on this lode 150 ft. more, making 217 ft. in all. A tunnel was run 100 ft. into the hill to strike the Degman lode, when at that distance they struck pay rock about as rich as the Eureka. Polk & Kabler's mill will be running by the 1st. of October. It is a 10-stamp mill, running by water power. They have already dug out a sufficiency of ore to keep the mill going continuously with what they may take out. Another mill is in the course of construction, to run by water power, by Searles, Yates & Henderson. It will be a 10-stamp mill, and will be finished in six weeks. Many excellent lodes of gold bearing quartz have been discovered lately, both by Americans and Mexicans, and new discoveries are daily being made.

Mariposa County.

Gazette, Sept. 25th: We are informed that the erection of a mill at the recently developed vein of Fine, Williams & Co., on the Buckingham Mountain, is rapidly progressing under the energetic management of those gentlemen. The prospects of a rich yield from the rock continue highly flattering.

Mono County.

Sacramento *Union*, Sept. 26th: There was shipped to San Francisco, by Wells, Fargo & Co. yesterday, about five tons of crude bullion, worth about $1.50 or $2 per pound, from the furnace of Williams & Wickland, Blind Springs district, Benton, Mono County.

Nevada County.

Transcript, Sept. 24th: The mill recently sold by Marcelus & Maltman to W. M. Eddy and put up on his claims at French Corral, was started up for regular work on Monday. Eddy is working the blue cement in his claims, and he has enough stripped to keep the mill going for three years.

Thos. Bell and others have located 1,000 feet on the extension of the Jim Crack ledge at Graniteville.

Sept. 27th: The Empire mine, of Grass Valley, is now yielding magnificent rock. The mine is opened to the depth of 800 ft., and the new hoisting works which are being erected, are the finest in the State. The ledge is now larger and the rock richer than they have ever had in the mine. From three car loads raised on Friday they got $2,000 in gold.

Gazette, Sept. 23d: Quartz mining in Eureka district is in a prosperous condition. Scarcely a crushing has been made this season that has failed to yield what would be considered large pay in this part of the county. The Black and Young mill is employed constantly in crushing rock from the Brambury ledge, which is yielding largely. The last crushing from the Mutual mine did not yield as well as anticipated, but was more than sufficient to pay expenses. It will be two or three weeks before Palmer's mill will be ready to commence operations, and several companies are waiting until it is completed to have their rock crushed. Crandall is putting up a mill for Veatch and others.

Sept. 24th: The mill of the Idaho Co. is nearly completed, and will be started up in a few days.

A crushing of 120 tons of rock from the Rising Star mine, made at the Cornish mill, was cleaned up a day or two since, and the yield exceeded the expectations of the owners. About 100 tons of the rock was taken from a stringer, and was regarded as a poor quality, perhaps paying only about the cost of mining and crushing; but the last 20 tons from the main ledge, was very rich, and it is thought would have yielded, had it been crushed separately, not less than $150 a ton. In cleaning up the battery, they took out some 20 ozs. of coarse gold, some of the pieces weighing $4 and $5.

Grass Valley *National*, Sept. 22d: Wm. M. Eddy started up his 15-stamp cement mill at French Corral yesterday morning, for constant work. It will run night and day, and will be able to reduce from 75 to 100 tons of cement every 24 hours.

The Star Co., at North San Juan, cleaned up $10,000 after the last run.

Sept. 24th: The 10-stamp mill formerly used by the Ione Co. is being put up at the Coe Co's mine. The ledge at the bottom of the incline is two to four feet thick, and is now being stripped down. The rock shows well in gold, and rich, heavy sulphurets. We saw some of the rock which was very rich—the gold could be traced through the pieces very plainly.

Grass Valley *Union*, Sept. 28th: Rock is being crushed from the Diamond ledge, near the Ione, in the Gold Hill mill, and quartz from the North Star and Massachusetts Hill is awaiting its turn.

EXCELSIOR.—*Transcript*, Sept. 24th: B. Emery & Co. have located 1,000 ft. on the American ledge, Meadow Lake township. This claim is located near Excelsior Ravine.

Sept. 26th: The battery of the Mohawk & Montreal mine consists of 10 stamps driven by an upright 15-horse power engine. Everything about the mill is admirably adapted for use. The mine has been sufficiently opened to prove its value beyond question, and the enterprise is no longer experimental. The shaft is down 213 feet, and there are two tunnels piercing the face of the mountain and running toward the shaft. A new opening has been made further up the hill, and from all the openings excellent pay is being taken. The rock is mostly decomposed with an abundance of free gold, and very rich sulphuret. The ledge is from three to five feet in width, and the rock will average about $100 per ton. The mine is admirably arranged for working. From the mouth of the tunnel is a double track, on which cars run up and down to a shute, through which the ore is dumped in the mill, saving all expense of hauling. Eighteen men are now at work in the mine and a force of 30 is employed about the works of the company.

Plumas County.

Quincy *National*, Sept. 24th: A company of miners have discovered what are supposed to be very extensive and rich placer diggings, at the lower end of Buck's Valley, in this county. We also learn that a company of miners are making big wages on Grizzly Creek, near the same locality.

Sierra County.

Downieville *Meisenger*, Sept. 26th: The mill upon the Brush Creek mine has been running about three weeks, and during that time some $4,000 have been taken from the ontside plates. A large return is expected when they clean up.

Siskiyou County.

Yreka *Union*, Sept. 26th: We learn that the mines on McAdams Creek, are paying better than usual. Carroll & Co., after several months work, have struck good pay in their claim.

Tuolumne County.

Sonora *Democrat*, Sept. 26th: We hear that very rich rock is now being taken out of the Excelsior mine at Uniontown.

Yuba County.

Marysville *Appeal*, Sept. 24th: We learn that both the Pennsylvania and Rattlesnake mines are taking out rich rock, the latter richer and in larger quantities than at any previous time.

ARIZONA.

Prescott *Miner*, Sept. 12th: Work will be commenced next week at the Sterling mine.

Tunneling is still going on at the Chase mine, in the Hassayampa district. A shaft is being sunk upon the Platanca lode, and the "concentrators" are in high glee.

The miners of Walker's district are working away, and don't intend to clean up until the water dries up.

The other day, Bob Osborn gave us a squint at a chunk of gold about as big as a common-sized plum, which he recently found in his claim at Big Bug.

A friend who is now and has been for a long time past, at work in the Vulture mine, informs us that the lode was looking well. Smith's claim was yielding plenty of good rock, and tons upon tons of the same sort were in sight. The Vulture Mining Co's claim was also yielding very rich ore, and last week the workmen struck a pocket of very rich specimens.

Santa Fe *Gazette*, Aug. 29th: Abraham Lyon, of Tucson, Arizona, visited our city last Saturday, and brought with him some of the finest specimens of gold bearing quartz it has ever been our fortune to see. The quartz is white or rose colored, and is not what would be styled the "burnt quartz." In the specimens seen by us the gold is very easily seen by the naked eye and in some instances beautiful clusters of wire gold, and pretty good sized chunks are seen.

Virginia *Enterprise*, Sept. 25th: Herman Schoeneman who has been on a southern prospecting tour, returned yesterday. His last exploit was an adventurous expedition with a party of 15 men to Arizona and into the Apache country. Although the Indians hovered about them continually, and either attacked them or made some sort of demonstrations against them daily, the party succeeded in penetrating far into their country, and discovered a region which they believe to be as rich as were those of California in early times. In one place Mr. Schoeneman obtained three bits in washed gold in coarse grains from a single pan of dirt, carrying the dirt 15 miles to wash it. The dirt was not scraped from the crevices of a ravine, but was taken from a hill of gravel. Water could be got upon these gold fields and immense fortunes taken out of the diggings but for the relentless hostility of the Apaches. No small party can stay in the country.

COLORADO.

Central City *Herald*, Sept. 9th: J. A. Conlee is putting up a new building and hoisting rig over his claim on the Burroughs. He is still running his Galena mill on ore from the Burroughs, which yields at the rate of $200, gold, to the cord.... Mr. Cameron, who is working on North Clear Creek, has struck a very rich pay streak. He has his claims in better shape for working advantageously, than ever before, and expects to take out a large amount of gold before the close of the mining season.... The silver lodes in the vicinity of Black Hawk are attracting no little attention. We are informed that there are, at least, 150 men prospecting and developing the silver mines of this section.... Mr. Richard Glennan, who is working his own property on the Mack lode, showed us a chunk of retort this morning which will weigh about eight ozs., the product of two cords. He is running it in the old Wilson mill, Ed. Moore proprietor. The Mack is looking well, having a wide vein of pay which is easily taken out. ....Hindman, Sherrick & Pennison have discovered a new lode, just below East Nevada, which bids fair to outstrip anything yet discovered in that immediate vicinity. At a depth of 20 ft. they have a 5-ft. crevice of quartz and pay dirt, which yields $120 per cord. This is not a selected quality of quartz but may be safely taken as an average of the crevice matter. Mr. Tascher, of Eureka Gulch, has engaged all the quartz they can raise.

Central City *Register*, Sept. 17th: Two lots of ore from the Champion lode, Trail Run, recently reduced by C. T. Sahin, at the Whale mill, yielding respectively $35 and $105 per ton, getting, in both cases, more than 80 per cent. of the gold which was shown, by careful assays, to be in the ore....One ton of ore from the Star of the West mine, at the head of North Boulder, is being brought over to be reduced by Prof. Hill. Prof. J. Alden Smith has made several assays of the ore, running from $25 to $60 per ton....The Narragansett mine on Gregory Hill, under the superintendence of F. J. Sweet, is turning out about 18 cords of ore per week, which yields from $140 to $180 per cord....Andrew Mason & Co., at Empire, are mining the Knickerbocker mill on Tenth Legion ore, and is getting very good results. There are also four arastras in operation there. They have been running all summer, mostly on surface ores from the Conqueror and other neighboring lodes, and the results have been very satisfactory. There are many very promising lodes at and about Empire, and a large amount of very rich ore has been raised and reduced there.

Georgetown *Miner*, Sept. 10th: The German Reduction Works started up again on last Tuesday.

John T. Herrick shipped on Tuesday last, 126 lbs. Troy, of silver bullion, coin value $2,041.20.

Isaacs & Merrill are developing the Wall Street lode, Montana district, nearly opposite the Young America. They have a 10-inch vein of decomposed talc rock, carrying sulphurets of silver in abundance. The lowest assay ever obtained from the ore was 800 ozs. of silver to the ton, and the highest $3,584. A small lot of this ore has been taken to the German Reduction Works for treatment.

IDAHO.

Lewiston *Journal*, Sept. 5th: The Roberson party of prospectors who went to search for the mythical gold lead, have returned. They report having found no lead, but did find gold almost everywhere that they prospected in the gulches and on the streams, however in not sufficient quantities to warrant their remaining to work.

Peter Donnolly has lately been on a visit to Altaras. He informs us that there are many large and rich quartz lodes in that county, with excellent facilities for working them, but little is being done at present.

Owyhee *Avalanche*, Sept. 19th: Another rich quartz discovery has been made on the mountain to the left of Jordan Creek, about 2½ miles from town. Reagan and others are the locators, and have christened the discovery the Seymour. The vein is represented as being from three to four feet wide, and prospects rich in both gold and silver. The quartz is decomposed, and large quantities of it can be easily taken out.

A shaft is being sunk on the new discovery called the Savage. The quartz appears to contain a large proportion of gold the deeper it is worked. The vein has also been struck in the gulch south of the discovery shaft, and prospects well. The parties owning the first extension south of the Savage will commence work next week.

MONTANA.

Helena *Post*, Sept. 18th: Day before yesterday, F. Bohm & Co. smelted 1,400 ozs. of gold, valued at $24,517.37 in gold coin. A portion of this consisted of an immense gold brick, weighing 1,000 ounces, and valued at $18,195.33 in gold coin.

Claims Nos. 9 and 10, above Discovery, in Last Chance Gulch, above Chinatown, are paying well. This ground has been

long considered valueless, but is now turning out from $12 to $14 per day to the hand, with the prospect that it will keep on doing so for a long time to come.

The Hendrie & Woodworth Mill and Mining Co., Rochester district, is now energetically at work, and is one of the finest in the Territory. The "clean up" for the last two weeks was 300 ounces of retort, which has been forwarded to Helena. The The above is the result of only two weeks' crushing with their 8-stamp mill on ore from the Watseka lode.

After working three days on the Poor Man's Joy lode at Phillipsburg, a portion of the machinery of the St. Louis & Montana Co's mill broke, and it was obliged to suspend operations. At the time that the break occurred, the amalgamator declared that the amalgam looked better than he had ever seen it after a run of the same length of time in any mill or upon any rock.

The drain ditch in Confederate Gulch, which was caused to cave in by a flood of water early in the summer, and the famously rich claims from which it draws the moisture, are yielding up their golden treasures in a fabulous manner. During the last week, Williams & Co. were taking out $1,000 to the set of timbers, and at about the same time Metcalf & Co. cleaned up $1,500 from three feet square of earth taken from the bed rock. All the other claims in the vicinity are doing exceedingly well. The nearer the work is prosecuted to the mouth of Montana Gulch the richer grows the pay, and the most sanguine golden dreams seem about to be realized. Work in the bed-rock flume in Montana Gulch has been suspended, as it was feared the tailings might interfere with the workings of the claims in Confederate. Work upon the King & Gillette bed-rock flume is being prosecuted. Between it and El Dorado Bar in Confederate Gulch the drain ditches are being opened, and will probably reach bed-rock before the winter. El Dorado Bar itself has been sufficiently worked to prove it one of the richest gold deposits in the Territory. Three weeks ago, the California Co. worked upon it—cleaned up $2,200, this being at the rate of $30.40 to the man for every day that had been employed in setting boxes and pipe and washing. The giving out of the water compelled a temporary suspension of operations.

The Omaha *Republican* says that on the 20th there were in the window of the Omaha National Bank five very beautiful gold bricks, which had been purchased the day before of miners down from Montana. Their aggregate weight was 518 ounces, and they were worth $9,378.63.

The Virginia *Democrat* says Henry Gowing and partner discovered a quartz lead, supposed to be very rich, in Brown's Gulch.

The Deer Lodge *Independent* says that $3,000 was recently paid for 25 feet of ground in Bear Gulch, and $10,000 offered for a half interest in another claim.

NEVADA.

Humboldt.

Winnemucca *Argent*, Sept. 24th: Mr. Negus brought down 20 lbs. of crude bullion for shipment, Tuesday last—the product of a week's run from the Golconda ledge.

Reese River.

Austin *Reveille*, Sept. 19th: The camp at Ophir has suddenly lost its activity by the closing of the works of the Twin River Co.

Sept. 21st: David Lundbom received today for assaying, five bars of bullion from the mill of the Monte Cristo Co., at White Pine. The bullion is the product of ore obtained from the Hidden Treasure mine, and the bars average .975 fine.

The mill of the Silver Peak and Red Mountain Co., Silver Peak district, is to be enlarged by the addition of ten stamps, and the proper amalgamating apparatus.

Sept. 24th: Yesterday afternoon, 3,000 ozs. of crude bullion were brought into this city from Rigby's mill, in the district of San Antonio.

Two bars of bullion, valued at $1,731.51, were brought into this city to-day from the Old Dominion mill at Hot Creek.

The Virginia *Enterprise* of Sept. 27th, says: We think there can be very little doubt that the White Pine will prove one of the richest mineral districts in our State. The extent of the veins or their permanency can not yet be conjectured with any degree of certainty; but as to the richness of the silver deposits already developed, we have the most undoubted assurances. Large deposits of "horn silver" have been discovered as far down as the miners have yet explored, and in some instances these strata are marvellously rich. The Treasure mine is yielding about $20,000 a month from rock with very poor facilities for crushing; whilst nearly all the companies are storing their richest ore for shipment, or until such a time as reducing conveniences shall have been obtained. We are told by a gentleman who has spent some time in the district, that White Pine reminds him very much of the early placer times in California. A stranger, who announces his intention of prospecting, can procure all the credit he wants from the merchants, who accept the ore in payment. There is no difficulty in opening to pay ore, and the superficial wealth of the section seems to be extensive and accessible. Our informant says that the "horn silver" is composed so largely of the precious metal that it readily receives the exact impress of a coin when stamped upon its surface. There is considerable dispute in regard to ownerships, but not so much so as we have been led to surmise. Litigation will doubtless reap a rich harvest, but as far as we can learn, the mere rough jumpers will not be permitted to hold claims to which they have only a possessory title based on force. The miners are waiting anxiously for the completion of smelting works, now being erected by J. R. Murphy, at White Pine. The "horn ore" is so largely impregnated with silver that the crushing process has no effect upon it, and it is believed that the metal can be readily separated by the smelting works alluded to. Should this prove to be the case, it will be turned into bars on the spot; if not, it will be shipped to Swansea. Timber is plentiful in the district, and firewood costs but $3 a cord. The accommodations are not sufficient to meet the requirements of the population, and unless a large portion of the people already in the district select winter quarters elsewhere, there will be much suffering before spring.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Sept. 24th: The new Ophir shaft has now attained a depth of 450 feet. The rock is still very hard, but sinking progresses at the rate of twelve ft. per week, notwithstanding. The Giant powder is used in blasting, and is found to be the best explosive that has yet been used. Nitro-glycerine was used for a time, but the workmen were so much afraid of it that its use has been discontinued, and the use of the Giant powder resumed.

Sept. 25th: The Savage Mining Co. will shortly put up one of Root's patent blowers, with which to furnish a supply of fresh air to the workmen in the lower levels.

A gold brick worth $9,442.74, from the Wilson mine, Pine Grove, was night before last shipped from the office of Wells, Fargo & Co., in this city. The Wilson mine is the best gold mine in this State, though in the same district there are several other leads of gold-bearing quartz that promise soon to rival it in productiveness.

The total shipment of bullion during the past week from this city and Gold Hill, was 7,029 pounds, worth $168,764—1,044 pounds and $81,123.20 less than the week previous.

Sept. 27th: The Overman Mining Co. have started up the works of the Uncle Sam in order to drain the shaft of water. When this is done they will open connections between the Overman and Uncle Sam for the improvement of the ventilation, and will also use the Sam shaft for hoisting ores.

The horse railroad of the Crown Point, Yellow Jacket and Keatuck mining companies, at Gold Hill, for the purpose of carrying the waste dirt to some distance from their respective mines, is complete and in operation. By the new arrangement the waste rock is carried to a spot at such a distance from the mines that it is out of the way of all mining operations. It was necessary to adopt some such plan, as the huge dump piles of the mines were in a fair way to overwhelm and obliterate the pent up Utica known as Gold Hill.

NEW MEXICO.

Santa Fe *New Mexican*, Sept. 1st: We have before us a report of an assay made by Brown & Co., assayers in this city, of some quartz from the claims of John D. Baker, of the New Placers, which yields $130 to the ton. This lead, with others near it belonging to Messrs. Cooley & Co., was believed to be rich, was known to be good. The assay of the quartz from it proves it not only to be rich, but very rich.

The Arizona *Miner* of Sept. 12th says that a gentleman, a resident of the Cimarron country, New Mexico, writes to a friend in this city advising him and his friends to stop right where they are. He says it costs a pile of money to open a mine at Cimarron, and that every claim is not rich.

OREGON.

Jacksonville *Sentinel*, Sept. 19th: Last Sunday a miner named Wm. Harriott, found a chunk of gold on Applegate Creek, near Steamboat City, that weighs 41 ozs., and is worth about $680. This piece is on exhibition at the banking house of C. C. Beckman. Another weighing 69 ounces, was taken out on Saturday.

Dalles *Mountaineer*, Sept. 11th: The Cañon City correspondent writes: For the last few days Canon City has presented quite a lively appearance, occasioned by the recent discovery of new diggings which promises to be very rich, outstripping anything yet found on the waters of the John Day. It has long been known that gold existed on what is known as the left hand branch of Cañon Creek, but for various reasons the stream was never prospected, until recently. Some time since a party left this place on a prospecting tour, and after rambling about for some time, concluded to try this creek, and the result is, they have struck it—30 cents to the pan and no bedrock yet; the prettiest gravel in the world, and every indication of very rich diggings. Arrangements have been made for thoroughly prospecting the creek.

The new camp at Burnt River is creating considerable sensation. That rich diggings exist on Burnt and Powder rivers, is no longer a question of doubt, and many are leaving for these camps. The scarcity of water will retard the developing of that section this season, but this will be overcome by next season, as there are two large ditches now under way, and will be completed this fall. It is conceded that Burnt River will be one of the best mining camps east of the mountains.

The news from Elk, Granite and Olive districts are quite cheering. The present season has been quite remunerative so far, and promises a continuance.

WYOMING.

A letter from Summit, Aug. 3d, published in the *Frontier Index*, says: The gold fever is at blood heat. New discoveries are being made every day or two. One man came in from the south base of Elk Mountain this morning with $780 in dust, which he had worked out in seven days with the aid of nothing more than a pick and frying pan. I was in Laramie City when he arrived. The report caused great excitement. A company has been organized, and a large party will leave to-morrow for the rich diggings, 60 miles northwest of Laramie, are producing a handsome yield.

Coöperative Colonization.—The Becket lumbermen's and tanners' colony planted by Wheeler and Claflin in the wilderness at Caroga, New York, prospers. Three lumber mills are running, and the large tannery has been put into successful operation. To the 14,000 acres contained in the first purchases of land, 1,000 more have been recently added. The old army road, cut through the region in 1812, has long since fallen into disuse, and is grown up with trees. It was some time ago rebuilt four miles, and is now being made through to the Sacanadaga river, the whole distance nine miles, being across the territory owned by Wheeler and Claflin. The erection of another large tannery will be begun early in the fall. The settlers were obliged to send a distance of eight miles for letters, but have recently established a post-office at their principal settlement, named Pine Lake.—*Industrial Gazette.*

The New Atlantic Cable.—The termini of the new French-American Atlantic cable will be Brest, in Europe, and the French island of St. Pierre, off Newfoundland, and thence probably to Plymouth, Massachusetts, on the American side. The first of the two sections composing the line, from Brest to St. Pierre, will be 2,325 miles long, and the second, from St. Pierre to the United States, 722 miles. The cable from Valeutia to Newfoundland being less than 1,900 miles, that to St. Pierre is much longer, but it is conjectured that by giving a greater weight of copper to the conductor, messages will be transmitted with equal speed. By the contract the cable is to be shipped next June, and the line is expected to be opened for traffic in the course of 1869. The French Government made their concession to D'Erlauger and Reuter, binding itself not to grant any other for twenty years, dating from September 1st, 1869. The company formed by these gentlemen is mainly composed of Englishmen.

Several patents have been recently taken out in Australia for the preservation of Australian meat for exportation, and various establishments of this kind have commenced operations, and are reported to be rapidly extending their business with the mother country, and with Hamburg.

Automatic and Telegraphic Signaling in Mines.—The objection to telegraphic communication underground is its expense and liability to derangement. Mr. Fred. Gisherne has invented automatic signals for ships, and appreciating the importance of providing equal facilities for communicating from various points in a mine to the engine driver, he has prepared a modification of the same, in order to render it applicable to mines. The apparatus consists essentially of a balance-chain, working around indented pulleys, each pulley being placed in the center of a dial, and furnished with an index, the connection being so made that neither of the pointers can move without all the others adopting a precisely similar course. It is supposed to let the dial "men," "up," "stop," "down," "men," respectively, and whenever either one of the pointers is directed to say "up" the engine-room bell gives the proper signal, and every pointer in the connection is at the same instant turned to "up" also—in fact, the dials may be lettered to suit any kind of wording that may be considered necessary. For economy and convenience it is proposed to substitute, wherever any straight lengths occur, ¼-inch iron rods for the chains. As the weights in the engine-room and at the other end of the rods exactly balance each other, the index has no tendency to return to any zero, but remains at whatever point it may be set—a circumstance which it is considered would be of immense advantage in case of an accident, from the facility it would offer for determining upon whom the blame, if any; rested, by affording conclusive evidence as to whether an order had been carelessly given, or had not been properly acted upon.

It is proposed not only to apply these signals in the shaft, but also in inclined planes, and in levels, indexes being provided at short distances, so that in case of accidents, such as the trams getting off the rails, the lad in charge can instantly communicate with the engine-man, and prevent the damage which would otherwise be inevitable. The special advantages claimed are that a single connector (composed of ¼-inch diameter rods, with chains and angles) is required to transmit orders and receive replies between any number of communicators and indicators, all of which work in perfect unison; the connecting rods (having balance weights at each end thereof) take up any slack, or yield to contraction, so that when once fixed they continue self-adjusting, and for like reason they transmit signals steadily, but little power being required to move them; the pointers and transmitting handles of every communicator and indicator can be quickly adjusted to the center of a common order by simply turning the ontside binding screw, which holds them in position. The apparatus is so simple in design, that any ordinary mechanic can fit it; and the cost price is small, and fitting inexpensive.

Farm Lands and Farmers.—Many people seem incapable of thinking for themselves. Such men require a leader, one of bolder and wider scope of thought; one who can originate and plan. But so soon as one or two men of this stamp take the initiative, with any degree of success, they are immediately brought face to face with a host of imitators. The Kilbourn Bros., of Napa City, last fall purchased 444 acres of unimproved land for two dollars and a half per acre, or $1,110 for the tract, which is situated in the San Joaquin Valley, eight miles southeast from Antioch. Of this quantity, 320 acres was seeded to wheat, and 124 acres were summer fallowed. They have sold the yield of the 320 acres for $20,000, and resold the entire tract for $15,000, making a clear gain of $14,810 on the land alone, and probably as much more from the wheat.—*Commercial Herald.*

Nevada Springs.—A chemical analysis of the waters of the Steamboat Springs of Washoe Valley, show them to contain in various proportions the chlorides of sodium and magnesium, with soda in different forms, lime, silica, and a small percentage of organic matter. Similar tests made of the water from other springs disclose nearly the same constituent salts, with the addition in some cases of sulphur and iron. Some of the cold springs, especially those found in the larger valleys, are quite as remarkable for their depth and dimensions as the thermals.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868

DR. L. G. YATES is our duly authorized traveling agent. July 6, 1867

MR. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:

Saturday Morning, Oct. 3, 1868.

Notices to Correspondents.

DISINFECTANT.—Oxygenated water, or as it is frequently termed, "peroxide of hydrogen," would no doubt prove efficacious in destroying in many cases, miasmatic and contagious influences. This compound was first discovered by Thenard, in 1818, who obtained it by dissolving the peroxide of barium in muriatic acid and water, and afterwards adding sufficient sulphuric acid to precipitate the baryites in the form of the insoluble sulphate. On several repetitions of this process, the excess of oxygen of the peroxide of barium becomes transferred to the water, and the latter becomes eventually saturated with oxygen. There are, however, many difficulties attendant on the execution of the operation, so that it has seldom been successfully repeated. Thenard considered the extraordinary compound so formed as a definite combination of one atom of hydrogen to two of oxygen; others surmise from its properties and mode of formation that it may be an aqueous solution of liquid oxygen. Peroxide of potassium, sodium, strontium, or calcium, when treated similarly to peroxide of barium, will produce similar effects. When black oxide of manganese purified by boiling in water from metallic chlorides, is mixed in a corked flask with three-fourths of its weight of fuming sulphuric acid and six times its weight of water, and the mixture left to stand; the watery liquid acquires an odor resembling that of chlorine and the property of blenching linen.

CRUCIBLE, Grass Valley.—Artificial graphite or plumbago is occasionally found eliminated from crude cast iron after solidifying, especially in those cases where that metal, as it flows from the furnace, is highly charged with carbon. In such cases, the plumbago will be found in metallic shining laminæ. Graphite in a similar state may be produced by mixing two parts of iron filings, one part of black oxide of manganese, and one part of lamp black, and heating the mixture to whiteness in a crucible. When cast iron, intersected with laminæ of graphite is dissolved in aqua regia, the graphite remains, mixed with gelatinous silica; the latter can be removed by a solution of caustic potash or soda and repeated boiling with water. When cast iron of this description is melted in a crucible, the iron runs off from the graphite, and the laminæ of that substance may be separated from the iron still adhering to them, by reducing them to powder, and removing the iron by a magnet. In this manner, according to Sefstrom, the iron may be almost wholly removed from this species of artificial graphite without the employment of any acid for this purpose. From the fact just stated, Sefstrom concluded that iron did not necessarily form an essential constituent of graphito, as was formerly supposed, but is simply associated mechanically as an accidental ingredient. A specimen of natural graphite, examined by Wollastou, contained mangauese.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Inventions and Inventors.

It is a matter of no little wonder to many persons that so many patents for new inventions are taken out yearly, and that each year the number of issues is greatly increasing. Many persons seem to think that the subjects for patents will soon be exhausted, and the inventive genius of our country will no longer be needed. It is true that real inventions are, at the present day, very few; but the world is full of machinery which can be improved and altered so as to be rendered more effective and economical in its working. Every new invention stimulates the inventive mind, and the piece of mechanism which, in the hands of the first inventor does its work sluggishly and imperfectly, is built upon and improved by other minds until it soon reaches a state of great perfection. Almost every part of any machine is susceptible of many changes, and each change, if new and important, is susceptible of being patented. First establish a ruling principle in any of the branches of industry or science, and many minds stand ready to take up the theory and put it to a practical test, and by experiment improve it until it becomes a thorough and perfect rule.

Little did Franklin think, when he sent his kite up among the warring clouds, and by means of a common door key, "stole their lightning," that he was developing a germ that would finally, after passing through the hands of inventive persons, become one of the greatest blessings known to the world. To-day, wires encircle almost the entire globe, and the same fluid that Franklin then invoked from the clouds, carries our messages almost with the speed of thought around its circuit. All this was not done by Franklin; yet his first discovery was the ground-work upon which other practical minds labored and produced the present results.

Since the introduction of steam as a motor, innumerable inventions have been discovered with that idea as the base, and the result is, the world has been knit together, as it were. Where our early settlers were compelled to trudge for six weary months over a sandy and desolate plain to reach the Pacific Coast, we can now jump on board the cars, and by the aid of steam be propelled almost on the wings of the wind a great portion of that distance, and before long we expect to be able to make the entire trip by the same means. This same power has been made to propel our largest vessels across the broad ocean, and a voyage at sea which formerly occupied the greatest portion of a year, can now be made in a few weeks, transporting the productions of one nation to the ports of another.

Little, too, did James Watt think, when, in his boyhood he sat in his familiar corner near the fireside, and took his first lesson in the properties of steam from watching the lid of his mother's tea-kettle dance merrily up and down, that he was originating an idea or principle, that in time would revolutionize the entire workings of the world. Upon that principle alone are based innumerable patents,—and yet perfection is not attained, and years to come there will, without doubt, be still further and notable improvements made in the uses and application of this motive power.

These inventions tend to move the world along at a greater speed, and confer a benefit on mankind that cannot be underrated, though they rarely reward the inventors. The mind of one man is not capable of grasping in a single lifetime the many and various plans and constructions necessary to a complete working of any principle, and as a consequence some other genius, taking up the ravel where the first discoverer drops it, improves and simplifies the construction, thus producing a more complete arrangement, and receiving all the benefits and reward.

Besides those already mentioned, the world is full of inventions of small articles, which help to increase the comfort and convenience of the people. Among these we may class the sewing machine, and the various portions of machinery for producing cloth from the raw material, besides innumerable other small and useful labor-saving machines,—all of which are capable of being greatly improved, in simplicity of construction and economy in working.

In this State we have made a specialty of producing inventions and improvements in machinery for saving the precious metals, and our inventors have generally been successful, as a visit to our interior mining counties will show. There we see the improved quartz mill, with its huge stamps crushing the rock which has lain perhaps for ages, and by means of the proper machinery and processes the precious metals are extracted,—and all this is the result of a home genius, which is daily growing more proficient in the principles which are involved in this branch of our industrial pursuits, and as a natural consequence, we may expect soon to gain such a proficiency as to enable us to work our ores to within a mere fraction of their assay value. Formerly, when our mountains teemed with prospectors, and gold was found in every gulch and on every bar, when the only machinery used to gather the gold from the sands, were the mining pan, the sluice-box and the long-tom,—when miners packed their dirt on their shoulders a mile or more to wash it, only a small proportion of the gold was saved; but now we see the mining ditch crowning the mountain top, and, winding down around its base, conveying the water to the very spot where it is required, and rushing down through the sluice and over the patent riffle boxes, and other appliances, depositing the precious metals in the very spot where the inventor intended it to be; and by the use of the hydraulic hose, the very mountains are in a short time leveled with the plain, and their hidden wealth gathered up to repay the hardy miner who has by the severest toil brought it to light.

While our mining interests have been so well cared for, the agricultural interests have not been neglected. We have, in this State, produced several important and praiseworthy inventions for cultivating the soil, which should not be overlooked. California is naturally rich in all that is requisite to make a great producing country, and all that is required to free the farmer from the heavy expense necessary for labor, is to produce the mechanical apparatus which is adapted to the peculiar products of our climate. It is estimated that the maturing crops of wheat in this State will yield upwards of twenty-five million bushels. The labor necessary for the production of this immense crop could not have been found in all our State, were it not for the inventor, who has supplied labor-saving machinery in every department of agriculture. It must be admitted that the improved agricultural machinery has added tenfold to the working capacity of our population in this department alone. The inventive talent of this State is not behind that of any other; if anything we may say that the old adage, that "necessity is the mother of invention," has operated to bring out more new and practical inventions, according to the number of our people, than that of any other State in the Union, and in importance and merit, they rank as first class among the inventions of the age.

We shall refer again to this subject of inventors and inventions, especially to those pertaining to this coast.

STATE FAIR.—The allotted number of days having expired, the State Fair has been brought to a close. The breed of running horses exhibited was the most noteworthy feature.

Chlorination Process on Silver Ores.

Mr. O. Hoffman, of the firm of Kustel & Co., left San Francisco on Tuesday's steamer for Sonora, Mexico, to introduce the chlorination process at the La Dura mine, on the Yaki River. The ore of this mine consists principally of argentiferous zinc-blende, fahlore, and some lead. Heretofore the ore was roasted in two revolving Brueckner's furnaces, with ten per cent. of salt, and then amalgamated in Varney's pans. The amalgam obtained from this operation is so heavily charged with base metals, that the retorted metal is not salable unless cupelled, whereby again some loss of silver must be suffered. There is from six to eight per cent. of copper in the ore, which, at the present mode of working, can not be realized.

The revolving furnaces are said to work to the satisfaction of the owners, and to require a great deal less labor, and only one-half of the usual quantity of fuel consumed in reverberatory furnaces. Mr. E. B. Smyth has succeeded in lining these furnaces with bricks in such a way that there is no trouble whatever in their use. To weaken the destructive influence of the chlorides, formed in roasting, some lime is added; but although the lime counteracts to some degree the loss of quicksilver it is nevertheless enormous, ranging from ten to fifteen pounds to the ton of ore. It is a matter of course that the pans are rapidly destroyed. Another inconvenience is the exposure of quicksilver and amalgam to the louging eyes of the Mexican laborers, who cannot help to come into contact therewith when there is the least necessity for it.

In order to gain the copper besides the silver, the company decided to try the chlorination process, and were so much pleased with the result,—which gave $81 per ton, while only $60 was obtained by pan amalgamation,—that Mr. Hoffman was engaged to accompany Mr. Smyth, and to start the chlorination without delay. The metal extracted by chlorination was .936 fine. Several tons of old scrap iron were shipped for the purpose of precipitating the copper.

DISCOVERY OF RICH QUARTZ VEINS IN NEW ZEALAND.—The last steamer from Panama brought papers announcing the opening in New Zealand of some of the richest quartz mines of the world; being situated on the northern island, sixty-five miles from Auckland. The Hunt mill, with four stamps, in two weeks, turned out 10,700 ounces of gold, .920 fine, worth $19 per ounce, and $203,300 in all; probably from selected ore. As a stamp crushes usually less than two tons per day, it is assumed that not more than 100 tons of quartz were crushed in the fortnight, making the yield $2,000 per ton on an average.

The Golden Crown extracted $19,000 from sixteen tons of quartz; the Bank of England $380 to the ton; the Eureka $170 to the ton; the Tookey $80 to the ton; and the Albarnia $950 from 115 pounds of quartz. The last, of course, was from a pocket, for it is at the rate of about $18,000 to the ton, and if they had much quartz of that character, they would not stop after crushing 115 pounds.

New Zealand began to produce gold in 1858, and for three years exported about $500,000 annually; in 1861 the sum suddenly rose to $3,600,000; in 1865 it was 11,000,000, and the production has continued at about the same rate since.

COMMERCIAL.—The French barque Guayaquil, has had her charter for dye woods from Altata, Mexico, to Cowes, cancelled, by reason of the unfriendliness existing between the French and the Mexicans, and has since accepted a charter to load lumber at Burrard's Inlet, British Columbia, for the west coast of South America, thence with nitrate to the United Kingdom, upon terms reserved.

Mining Titles--The Mineral Land Act to Cover Placer Claims.

The following decision of the Land Commissioner, is of great importance to the mining interests of the country:

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE, Aug. 28, 1868.

Register and Receiver United States Land Office, San Francisco, Cal.—GENTLEMEN:—This office has received a letter from A. Casselli, of San Francisco, President of the "Cherokee Flat Blue Gravel Company," incorporated under the laws of California, requesting to be informed whether said Company can obtain a patent for their claim under the mining Act of July 26th, 1866. In reference to the subject, the following is communicated: The mining Act provides for patenting veins, or lodes of quartz, or other rock in place, bearing gold, silver, cinnabar or copper, but furnishes no definition of the terms vein or lode. In geology and among miners they imply generally an aggregation of metallic matter found in the fissures of the rocks which encloses it, but are of great variety, veins differing very much in their formation and appearance. Lode is a term in general use among the tin miners of Cornwall, in England, and was introduced on the Pacific coast by emigrants from the Cornish mines, and signifies a fissure filled either by metallic or earthy matter. In Nevada the term ledge is usually employed in regulations concerning mines, and in Montana the terms lead, lode or ledge are similarly used. Ledge would seem to convey the idea of a layer or stratum of metal interposed between a course or ridge of rocks. Veins may be either sedimentary, plutonic or segregated, or of infiltration or attrition, depending upon their peculiar formation, or the mode of occurrence of the metallic deposits. In California, the ancient river channels, or what are supposed to be such, found in various mining districts, filled with a compact blue gravel rich in gold, are called the "blue lead," and frequently, in common parlance, the "blue vein." Even the shallow "diggings" or placers, are sometimes found to occur in such regular layers or courses as to receive from the miners working them the names of veins or leads. There is also another form of deposit of all or of some of the four metals mentioned in the mining Act, different from either of those mentioned above, called contact-deposit. European miners mention still others, called in England "Floors," in Germany "Stockwerke," and a form of deposit known as "Fahlbands." These latter are more properly speaking, ore-bearing belts, irregular in their dimensions, but presenting a degree of parallelism with each other. Neither is the mode of occurrence designated as "contact-deposit" considered as a true vein or lode. In fact, if the question were raised, neither of the forms known as contact-deposit, Fahlbands, or segregated veins, could be accepted as true metalliferous veins, nor could it be made to appear without expensive excavations, whether the metal in the mine for which a patent is applied for occurs in the form of a true vein or not. Hence we discover that a very strict construction placed upon the terms used in the mining act, would exclude from its benefits a large class of claims, even of the branch of rock mining, from the impossibility of proving the metallic deposit to occur in the form of a true vein. But there is no reason for supposing that the terms were employed according to their strict geological signification. The plain object of the law is to dispose, for money value, of the mineral lands of the United States, and if the claimant is willing to pay the price named in the Act it is clearly a matter of indifference to the Government whether the metal occurs in the form of a true or false vein, or whether in the form of a vein at all. There is certainly no public policy to be subserved by favoring one class of miners and excluding others, nor has the Commissioner ever heard any reason assigned why vein mines should be patented, and other deposits excluded from patent, nor any intimation expressed that such was the intention of the Act. An idea may have prevailed at the time of the passage of the law that the placers were becoming exhausted, and that their claimants did not care about buying the land or obtaining patents; or it may be that the act was drafted mainly in view of localities where placer mining constitutes a very inconsiderable branch of the business compared to rocky mining, and hence the phraseology of the act seems to have more direct reference to vein mining than any other branch. But whatever may be the cause of the phraseology adopted, it is very evident to the mind of the Commissioner that no purpose or design existed in the minds either of the framers of the bill or the Congress that passed it, to exclude any class of miners that chose to avail themselves of its provisions. Consequently the law should receive the most liberal construction that the language will admit of, and every class of claims that, either according to scientific accuracy or popular usage, can be classed and applied for as a vein or lode, may be patented under the law. It may be observed as an important point that no proof is required to establish the vein formation of the deposit, the law evidently contemplating none. It requires the Surveyor-General to certify "to the character of the vein exposed;" but that is understood to mean that the certificate should show whether the exposed vein contains gold, silver, cinnabar or copper, as it would frequently be impossible for the Surveyor-General, even if his knowledge of mineral veins were sufficient to render him otherwise competent, to determine whether the deposit conformed to one class of veins or the other, or whether it was a true vein at all, without extensive excavations - a requirement certainly not contemplated by the Mining Act.

The applicant claims a certain number of feet along the vein or lode, and as much surface ground on either or both sides of the same as is necessary for the convenient working of the mine. He may claim as many feet as the local law or mining regulations permit him to hold, not inconsistent with the Act of Congress, and as much surface ground as he needs, taking care not to conflict with any other claimant. The case being presented in this form no proof is necessary to show that the deposit appears in the form of a vein, the phraseology of the act appearing to render it evident that the claimant was not to be put to the necessity of producing such proof; the evidence called for being confined to the posting and publishing the necessary notices and diagrams; to proving the local mining customs; the location of the claim; possessory rights of the applicant, and the amount expended in actual labor and improvements; which, being satisfactory, and the Surveyor-General having made a proper survey and plat of the claim, with the required indorsements and certificates, a patent must issue to the applicant.

No reason is perceived why a blue gravel lead might not be presented in this form, both in the application and on the diagram and plat, and being presented, if the applicant is the *bona fide* holder of the claim, and it is clear of conflict, it will be patented to him without any proof being required as to the mode in which the deposit occurs.

To conform to the language of the Act, however, the claim must call for so many feet along the lead, and a given quantity of surface ground on one or both sides of the same.

You will please to communicate to Mr. Casselli the purport of this letter.

Very respectfully, your obedient servant,
JOSEPH S. WILSON, Commissioner.

According to a later decision, dated Sept. 1st, (which will appear next week) proof of citizenship is required in order to secure title to a mining claim, and an incorporated company is to be deemed an artificial person with the right to file claim and receive payment.

RAILWAY SUPPLIES AND MACHINERY.—M. B. Washburn's catalogue of railway supplies and machinery, of which a copy has been sent us, gives an idea of how railroad engineers must go to work in selecting and ordering piecemeal the multitudinous articles that they may require. Lists are given of different sized engine lathes, bolt-cutters, pillar and suspension drills, pumps, hydraulic jacks and punches, roller tube expanders, locomotive spring balances, steam traps, car ventilators, boiler tube cleaners, car moldings, machinists' tools, chucks, blocks, oilers, etc.; with the prices appertaining to each.

TROY POLYTECHNIC INSTITUTE.—The last catalogue of the Rensellaer Polytechnic Institute, shows that during the year ending July, 1868, there were 154 students in that institution, of whom twenty-two graduated,—seventeen as civil and five as mining engineers. The latter degree is now granted to students who pursue studies specially relating to mining and metallurgy during the last two years. James Hall, the well-known paleontologist, has charge of theoretical, practical and mining geology, and George W. Maynard of metallurgy and practical mining.

THE "MONITOR SPRING BED," invented by Mr. Sol. W. Easterday, is now being manufactured in San José, by Lankford & Easterday. The invention consists in conical shaped springs, each one surmounted by a small square board. These springs stand independent of each other, and the mattress is placed directly upon the blocks. This bed has received some very flattering testimonials from Santa Cruz County, commending its great strength, durability and adaptability. Letters patent have been applied for through the Patent Agency of the MINING AND SCIENTIFIC PRESS.

MULTUM IN PARVO.—If any one would see a world in a nutshell, let him visit Woodward's Gardens. He might travel round the globe and come in contact with fewer objects of interest than can be seen here in an hour. *

KNIT GOODS, consisting of shirts and drawers, hose and half hose, all wool or merino, are now manufactured of the very best quality at the Pacific Woolen Mills, and offered to the trade at lower rates than similar imported goods. *

FROM the army hospital; the bloody battlefield; the mansion of the rich and the humble abode of the poor—from the office and the sacred desk; from the mountain top, distant valley and far-off islands of the ocean—from every nook and corner of the civilized world, is pouring in the evidence of the astonishing effects of DRAKE'S PLANTATION BITTERS. Thousands upon thousands of letters like the following may be seen at our office:

* * * * I have been in the Army Hospital for fourteen months, speechless and nearly dead. At Alton, Ill., they gave me a bottle of Plantation Bitters. Three bottles have made me well again.
* C. H. FLAUTE.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-ajm

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and breaking out on any part of the
body, and also removes pain
of every name or nature instantly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 652 Market street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from actual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

PARTNER WANTED
FOR A
NEW INVENTION!

A gentleman who has recently invented a device for elevating snow, mud, etc., desires a partner for the purpose of bringing his device into practical use in this State. He is confident that it is an invention of great importance, and if rightly managed will prove remunerative to owners. For further information, address "J. A. B," Box 17, P. O., San Francisco. 14v17-1m

D. C. HALL,
WHOLESALE AND RETAIL
Ale, Porter, Wine and Liquor Merchant,
414 Market street, San Francisco.
☞City and country orders promptly attended to. Merchants, shippers, and families supplied in large or small quantities. 14v17 3m

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.
☞FIRE AND MARINE INSURANCE. 10v14t9pqr

Support Home Manufactures.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
SAFETY FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.

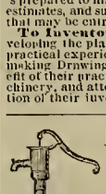
BOILER MAKERS

AND GENERAL MACHINISTS,

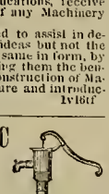
Howard st, between Fremont and Beale, San Francisco.

Fine or Tubular **Boilers**, with plain circular or spiral courses. Upright Fine or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.



Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.



To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

HYDROSTATIC WORKS.

SAN FRANCISCO

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House-Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all Kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Baden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, angle-actions. I am making four different kinds of double-acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country. I have now on hand thirteen Pumps in brass and iron, all of my own make.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom. Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair.

☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

CHARACTER OF THE UNION PACIFIC RAILROAD.—A correspondent of the Springfield *Republican*, writing from Denver (Col.) says:

The manner in which the road is being built, has been a subject of some dispute and considerable anxiety. From all I could see and hear, the character of the work is quite up to the average of other new roads in America—better, I should think, than most of the Western roads on their original completion. Of course, with such temptation to speed as exists, thoroughness is sacrificed to that at first; wide detours are made to avoid slow cuts; trestlework takes the place of pier bridges or high embankments, and the track is not filled up full and firm; but after getting ahead, contractors or company go back and perfect the line, cutting off unnecessary curves, putting in stone culverts and piers, and every way responding to the exactions of the Government commissioners who inspect the work, and by whose approval only can the road obtain the Government grants. Everything, in fact, depends upon these gentlemen; if the Government and the people are being cheated in the character of this work, they are responsible—it is because they are bribed or deceived into approval of imperfect construction. The standing and intelligence of at least two of the three commissioners—General Buford, of Rock Island, and General Frank P. Blair, the Democratic candidate for Vice-President—are as good guarantee as could be had, perhaps, that neither thing is done. They are evidently construing the bargain liberally to the company, but because they recognize the importance of the early completion of the road, and also because they have confidence in the purposo of the managers to repair all neglects and put the line into thorough condition.

SAVING OF SOLUBLE COPPER.—Scraps of iron may be used to secure the copper that runs away in the streams washing veins of copper pyrites. In the Mono company's mines, in North Wales, old pieces of battered iron are placed in tanks in which these streams are collected; the copper quickly incrusts the iron, and in process of time entirely dissolves it, so that a mass of copper takes the place of the iron. The residuum, in the shape of a colored deposit, is at times taken out, dried, and smelted. Before the adoption of this plan a great deal of copper escaped as a refuse into the sea. This simple laboratory device has, during the last few years, risen to a manufacturing scale.

AMERICAN BREECH-LOADERS IN EUROPE. E. Remington & Sons, of Illion, N. Y., have made and sent off to Denmark 30,000 of their breech-loading rifles, and 2,000 carbines, which are now in the hands of the Danish soldiers, and Gen. Raasloff, the Danish Secretary of War, writes that his Government has every reason to congratulate itself on the selection it has made. Remington & Co. have also just shipped to Sweden the last of 30,000 rifles ordered by the Swedish Government.

The Risdon Iron & Locomotive Works.

Incorporated, April 30, 1868. Capital, $1,000,000.

Scientific Schools in the United States.

The following is a list of the leading institutions of practical science in this country:

The Polytechnic College of Pennsylvania, situated in Philadelphia; courses, civil engineering, mechanical engineering, practical chemistry, agriculture, mines, architecture—all of which are two years, except the first mentioned, which is one year. The total attendance in 1865 was 136.

The Rensselaer Polytechnic Institute, situated in Troy, N. Y. It has courses of civil engineering, mechanical engineering, topographical engineering, and natural science; length of each, four years. The total attendance in 1865 was 150.

The scientific course of Union College, Schenectady, N. Y., was founded in 1845. The courses are applied chemistry and engineering—two years each. The attendance in 1865 was forty.

The Sheffield Scientific School is one of the professional schools around Yale College, New Haven. The courses are chemistry and natural science, engineering, agriculture, and mechanic arts; the length of all the courses, except the fourth mentioned (which is two) being three years. The attendance in 1865 was fifty-seven.

The Lawrence Scientific School, Cambridge, Mass., is one of the professional schools around Harvard College, and was founded in 1848. The courses are chemical, general and technical; zoölogy and geology, engineering, botany, comparative anatomy and physiology, mineralogy—all one year each. The attendance in 1864 was seventy-five.

The Chandler Scientific School is one of the professional schools around Dartmouth College, Hanover, N. H.; the attendance in 1865 was forty-eight.

The scientific courses in the University of Michigan, at Ann Arbor, are civil engineering (one year) natural history, general technical chemistry, mines, at the discretion of the student. The attendance in 1865 was eighty-two.

"Professional (Scientific) Department" is one of the professional schools of the University of New York City, has a professional department in which there are courses on civil engineering and architecture, analytical and practical chemistry—the former three and the latter two years, total attendance in 1865, thirty-one.

The Scientific Section of Washington University, St. Louis, Mo., has a general science and technical course of three years. The attendance in 1864 was seven.

The Cooper Union for the Advancement of Science and Art, in New York City, has a Free Night School of Science and a Free Night School of Art, a School of Design for Women, and a Scientific (Polytechnic Day) School. The attendance at the night schools in 1864 was 1,281; in the School of Design, 173.

The Collegiate and Engineering Institution of New York City, has a course of two years.

The School of Mines of Columbia College, New York City, has a course of six years. The attendance in 1865 was thirty-three.

The Massachusetts Institute of Technology, has courses on mechanical engineering, civil and topographical engineering, building and architecture; higher general sciences, etc., two years each. The attendance in 1865 was seventy-two.

Besides the above mentioned, there are the Worcester, Mass., Free Industrial Institute; the Cornell University, Ithaca, N. Y.; the University of South Suwanee, Tenn.; and the School of Mines in connection with Harvard College, Cambridge, Mass.

In Brown University, Providence, R. I., there is a department of chemistry and engineering; in the Scientific School of the New York Free Academy, there was an attendance in 1864 of 482. The Brooklyn Collegiate and Polytechnic Institute was founded in 1855.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

ANECDOTE OF FARADAY.—Twelve or thirteen years ago, says Prof. Tyndall, in the July number of the *American Journal of Science and Arts*, Mr. Faraday and myself quitted the Royal Institution one evening together, to pay a visit in Baker Street. He took my arm at the door, and pressing it to his side in his warm genial way, said, "Come, Tyndall, I will now show you something that will interest you." We walked northward, passed the house of Mr. Babbage, which drew forth a reference to the famous evening parties once assembled there. We reached Blandford street, and after a little looking about, he paused before a stationer's shop, and then went in. On entering the shop, his usual animation seemed doubled; he looked rapidly at everything it contained. To the left on entering was a door, through which he looked down into a little room, with a window in front facing Blandford street. Drawing me toward him, he said eagarly, "Look there, Tyndall; that was my working-place. I bound books in that little nook." A respectable-looking woman stood behind the counter; his conversation with me was too low to be heard by her, and he now turned to the counter to buy some cards as an excuse for our being there. He asked the woman her name—her predecessor's name—his predecessor's name. "That won't do," he said, with good-humored impatience, who was *his* predecessor?" "Mr. Riebau," she replied, and immediately added, as if suddenly recollecting herself, "He, sir, was the master of Sir Charles Faraday." "Nonsense!" he responded, "there is no such person." Great was her delight when I told her the name of her visitor; but she assured me that as soon as she saw him running about the shop, she felt—though she did not know why—that it must be "Sir Charles Faraday."

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash-boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the conning-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.
P. O. Box, No. 1057. 23v16-6m

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

Pacific Mail Steamship Co's

STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA,

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR OCTOBER, 1868.

The following Steamships will be dispatched on dates as given below:

October 6th—COLORADO..... Capt. W. F. Lapidge, Connecting with ALASKA, Capt Gray.
October 14th—GOLDEN CITY...Captain E. S. Farnsworth, Connecting with OCEAN QUEEN, Capt. King.
October 22d—SACRAMENTO.....Capt. W. H Parker, Connecting with HENRY CHAUNCEY, Capt. Connor.
October 30th—MONTANA..... Capt. J. M. Cavarly, Connecting with RISING STAR, Capt Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on SATURDAY, October 3d, at 12 o'clock M., from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR. G. W. CIGGI. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concavo surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v16 3m

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge*; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus debarring those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

Mining Notices.

Bunker Hill Quartz Mining Company. Location of Works: Near Amador, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of May, 1868, an assessment (No. 8) of ten dollars ($10) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to DANIEL PALMER, No. 134 State street, Boston, Massachusetts.

And whereas said assessment was not duly advertised as required by law, and as contemplated by the resolution making the levy, at a subsequent meeting of the Board of Trustees, held September 2d, 1868, it was resolved, that—

Any stock upon which said assessment shall remain unpaid on the sixth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WALES L. PALMER, Secretary.
Office, No. 19 First street, San Francisco, California. sep5

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the seventeenth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No Certificate.	No. shares.	Amount.
E C McComb	51	25	$25 00
P C Lander	48	75	75 00
P C Lander	51	150	150 00
John R Mead	49	50	50 00
Wesley Henderson	67	100	100 00
Albinus Ingle	74	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the 17th day of August, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on the twelfth day of October, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. sep26

Chiplonena Mining Company—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board Trustees of said Company, held on the seventh day of September, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street, up stairs.

Any stock upon which said assessment shall remain unpaid on the ninth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up-stairs, San Francisco. sep12

Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1867, an assessment of two ($2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 40 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary.
Office, Room 40 Merchants' Exchange Building, California street, San Francisco, Cal. sep12

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the twentieth day of August, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Richard Inch	34	40	$60 00
Richard Inch	35	30	45 00
Richard Inch	36	20	30 00
Richard Inch	38	6	9 00
Gomer Evans	335	94	125 00
Mary C Bridges	360	12¾	18 75
Thomas Prisk	351	5	7 50
Ann Hogan	176	7	10 50
Edmund Palacho	143	5	7 50
Isaac Ayer	146	4	6 00
Isaac Ayer	338	1	1 50
Wm Rowland	305	5	7 50
Wm Rowland	306	5	7 50
E E Wahlburg	174	10	15 00
L A Wahlburg	277	5	7 50
James Earls	355	9½	14 25
Henry Jardine	188	5	7 50
Henry Jardine	340	3	4 50
Henry Jardine	330	1 1/2	18 75
Henry Jardine	331	5	7 50
H G Blaisdell	27	9½	14 25
H G Blaisdell	292	15 16	1 40
E B Curtis	265	5	7 50

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of August, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at their salesrooms, No. 426 Montgomery street, San Francisco, on Wednesday, the seventh day of October, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. CROWNINSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. sep26

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of September, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. sep19

Nevada County Gold Mining Company, Nevada County, California.

Notice is hereby given to the Stockholders of the Nevada County Gold Mining Company, that a meeting will be held at the office of the Company, No. 9 Merchants' Exchange, California street, San Francisco, on MONDAY, the fifth day of October, 1868, at the hour of 12 o'clock, noon, for the purpose of electing officers, and the transaction of such other business as shall come before the meeting.

(Signed) E. S CURTIS, } Trustees and
B. WELLMAN, } Stockholders.
WM. NEWTON MEEKS, } Stockholders.
CHAS. HALSEY, }
San Francisco, Sept. 9th, 1868. sep13

North American Wood Preserving Company. Location of Works: San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the third day of September, 1868, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Room 32 New Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. B. LAKE, Secretary.
Office, 32 New Merchants' Exchange. sep5

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Geo C Perkins	97, 98, 99, 100, 101-to ea	75	$37 50
Ira P Rankin	not issued	100	50 00

Larkin Smith	261	50	25 00

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of August, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, Cal., on the twelfth day of October, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. H. PECK, Secretary.
Office, 212 Clay street, San Francisco. sep26

Providence Gold and Silver Mining Company, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. sep19

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Alberding, F H	16, 17, 26	3	$90 00
Cozens & Cleveland	32	1	30 00
Devin, Bendere & McMillin	not issued	2	60 00
Gillig, John	34, 37	32	960 00
Gray, T C	63	7	210 00
Hearst, George	27	10	300 00
Holt, E B, Jr	82, 84	10	300 00
McMillin Thos	75	1	30 00
McLaughlin, J W	74	50	1,500 00
Martinez, Ladislao	30	4	120 00
Wingard, A	22, 50, 53	16	480 00

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of August, 1868 so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the twenty-first day of September, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. sep5

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, the twenty-first day of October, 1868, at the same hour and place. By order of the Board of Trustees.
sep19 T. B. WINGARD, Secretary.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

Machinery.

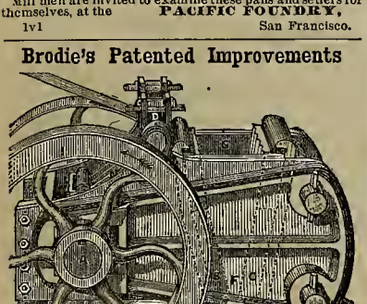
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st, San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

New Potato Digger.

Parties interested in saving considerable time and money by using the

PACIFIC

POTATO DIGGER AND SACKER,

Should not delay the present opportunity of having one in time for the late Potato crop this season.

☞ Liberal terms to Farmers' clubs ordering more than one. This arrangement secures to members in rotation the great benefit of a machine, and materially reduces their outlay. A Potato Digger of this kind is sufficiently strong for general ranch purposes, and will dig, clean and separate, according to sizes, and sack six to seven acres of potatoes daily, besides the important saving of so much time, and at less than half the cost of the present expensive and dilatory method by hand.

It would require one man from forty to fifty days to accomplish the same amount of work.

A WORKING MODEL may be seen from 11 to 12 and from 1 till 6 o'clock daily, in operation until the 10th of October, at Risdon's Machine Works, corner of Bea e and Howard streets, San Francisco.

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

[Continued from page 187.]

Igneous action in geology is equivalent to volcanic action, being the action of heat as is seen in the active volcanoes of the present day, the study of which led to the foundation of the plutonic or igneous school of geologists.

This action is not, as occasionally has been misrepresented, a mere dry fusion, such as would take place when the chemist fuses anhydrous substances in his crucible, and of which, as observation shows, no example can now be seen in nature's operations, but is one in which, whilst heat undoubtedly plays the grand part, is in nature invariably accompanied by the action of vapor and gases; and any one who ever has seen a volcano in eruption can bear testimony to the enormous volumes of vapor and gases which are emitted, and which, could meaus be discovered of measuring or weighing them, would be found to bear a very considerable ratio, to the total amount of solid matter actually sent forth by the eruption.

Aqueous Action.—The action of water (fresh or saline) such as we are accustomed to observe on the present surface of the earth; this is not, however, the mere solvent action of the pure water employed by the chemist in his researches in the laboratory; but is one in which the air, gases, salts, and other bodies contained in natural waters, along with the action of heat (by raising or lowering the temperature) materially alter the solvent powers of the water itself.

Gasolytic Action.—The action of gases and vapors more or less assisted by heat.

All these agencies are subject to be modified by the effects of chemical action and mechanical force, but whilst in all these cases, we have the action of heat, of water, and of gases, each playing a more or less prominent part; there can still be no grounds for misunderstanding or confusing the meaning of the three terms.

In igneous or volcanic action, we find that, whilst the effect of heat predominates, still the presence of heated vapors and gases exercises a most important influence in modifying the results; in this case, the water present is in the form of steam, although it is possible that a minute amount of water may be imagined to exist as water entangled in the melted rock under enormous pressure.

In aqueous action on the other hand, the water which acts as a liquid, not as a vapor, is the main agency; yet the effects of the air, gases, and solid constituents, as well as of its temperature, must be taken into full consideration, since they often may very materially affect the result.

In now attempting to apply the principles of chemistry, to the explanation of the changes which our globe has undergone, it appears most systematic and convenient, to commence at a point as far back in its history as the evidence furnished by the sciences of astronomy and physics can carry us, and from this point to work out step by step the subsequent phases which it has passed through. As however the first stages in such a chemico-geological chronicle must necessarily be but hypothetical, it is important, in the first instance, to assume as little as possible for granted; and therefore the sole axiom, on which this sketch is based, is the conclusion which astronomers and natural philosophers appear to have very generally arrived at, viz., that our globe was at one period in so highly heated a condition, that its entire solid contents were in a state of complete liquidity.

I am fully aware, that some observers have gone still further back, and imagined the whole of the constituents of the globe as having been previously in the gasiform condition as a nebula in space; and that they find evidence in the recent discoveries made by the spectroscope in support of this view; also that others have conjectured that the chemical elements in such a nebula would be in a "disassociated" state of chemical indifference to one another, until a lowering of temperature brought about combination and condensation.

Without disputing either the possibility or probability of these views, I consider that in the present state of our knowledge of the subject, it would be imprudent to adopt them; for too little is known either of the effect of such intense degrees of heat, or of the state of "disassociation" or indifference of heated gases, to warrant confidence being placed in conclusions based upon such imperfect data.

Chemists will no doubt admit that it is but fair to assume, that the chemical ele-

uents which then made up the world were he same, and possessed the same properies as those now recognized, as of course it nts an end to all reasoning upon this subect, if this be not granted; for the very supposition that the interior of the earth (with he exact nature of which we are and ever nust remain ignorant) was composed of lements unknown to the chemist, would at nce annihilate all calculations or deducions.

Having now an intensely heated world given us for consideration, it is in the first lace inferred, that this would be composed f bodies of two different characters—solid nd gasiform; which, by their situation nd rotation, would bring about the formaion of a molten sphere of the more refracory bodies, surrounded by an intensely eated gasiform atmosphere of the more volatile.

In considering the distribution of the hemical elements in this sphere and atmosphere, we must be guided by the knowledge we possess of the effect of intense heat upon the elementary bodies and their compounds; and it naturally follows that the more volatile bodies would remain longer in the atmosphere than the more refractory ones, which would be condensed previously into the sphere. It must also be remembered, that at so intense a temperature we should not only find in the atmosphere those bodies which are gaseous at ordinary temperatures, but in addition, many others, such as the vapors of various metals, etc., etc., which do not assume that form, except when exposed to extremely high heats.

The affinity of bodies for one another would no doubt also be considerably different at this temperature, and their mutual chemical reactions might also be expected to vary considerably from those which are known to take place at ordinary temperatures; and it is to be regretted that the effects of heat in modifying the affinity of bodies for one another, are as yet but very imperfectly understood, although it is proved that they possess a very strong influence in so doing: we know for example, that sodium will, at comparatively low temperatures, decompose carbonic acid, yet at much higher temperatures, carbon decomposes soda. Again, iron at a red heat decomposes water, whilst hydrogen at a similar heat decomposes the oxide of iron.

Under these circumstances, it is evident that great latitude is given to chemists when explaining the reactions which may be conjectured to have characterized this epoch in the earth's history, as at present it would be impossible to produce sufficient experimental evidence, to prove or disprove various different and apparently contradictory opinions which might be advanced to account for such phenomena.

I shall therefore here give a summary of the main conclusions, which the examination of this subject has caused me to arrive at, and then go into an examination of the arguments for and against their adoption.

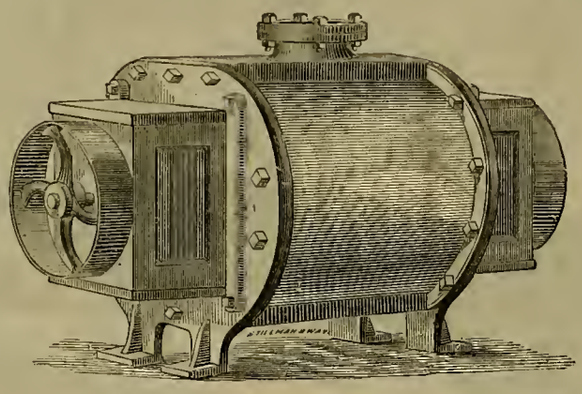
Supposing the grand battle of chemical combination at an end, and the compounds so formed, resting as it were during an armistice of neutralization, whilst at the same time the whole world still continued in a state of intense incandescence, I have ventured to imagine the state of things at this moment, as follows:—

Both in the molten sphere, and in the atmosphere surrounding it, the first impulse of these newly formed compounds would be to obey the laws of gravity, and so arrange themselves in strata or zones according to their respective densities; here I would remark that these separations are only to be regarded as approximative, for there would always be some greater or less admixture of the substance of one zone with another, either from mechanical entanglement or diffusion.

The solid sphere would resolve itself into some three grand zones (probably with subzones) it is imagined, somewhat as follows:—

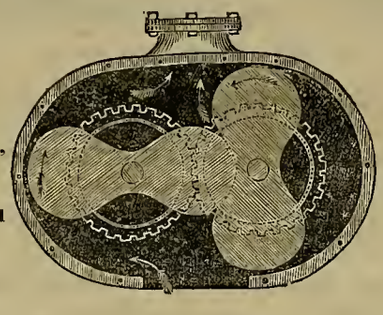
An external layer or crust of highly acid silicates, with most probably much free quartz, the bases of these silicates being chiefly alumina and potash with minor quantities of soda, lime, magnesia, etc. Below this a second zone of silicates of more basic character and greater density, the bases being lime, magnesia, alumina, oxide of iron, soda, with but minor quantities of potash, etc.; and still deeper, a far denser sphere or nucleus, containing most of the denser metallic elements, in part, at least, in combination with sulphur, arsenic, etc.

[Continued in our next.]



Franklin introduced broom-corn into his country. Previously, brooms were made of evergreen boughs.

Rain fell in considerable quantities on Wednesday and Thursday nights.



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

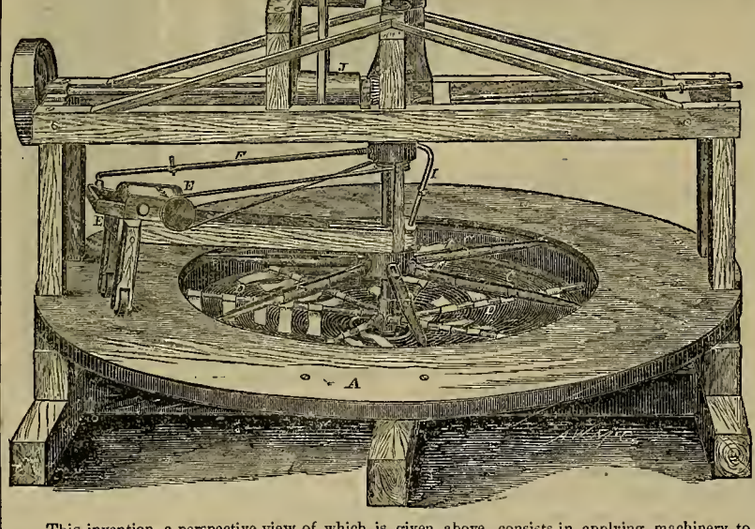
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.



For circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to Thomas N. Paine, Grass Valley, California.

PAINE, STEPHENS & HARRY.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to palm, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tm

NOTICE.

On and after this date, all parties on the Pacific coast manufacturing, using, or selling

Dunbar's Patent Piston Packing,

must obtain a License for the same from the undersigned or they will be subject to the penalties of the law.

H. S. SMITH,
Ætna Iron Works.

San Francisco, August 15th, 1868. 7v17-3m

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

We are indebted to Mr. A. B. Butler, for Nos. 237 to 249 inclusive.

No. 237.—Silver ore from Dr. Harkness' mine, forty miles from Austin, Nevada. Blue carbonate of copper with impure chloride of silver, and peroxide of iron. It is probably the result of the decomposition of copper pyrites and sulphurets of silver while exposed to the salt solutions of that alkaline country; the copper pyrites (copper, sulphur and iron) changing to sulphate of copper (little sulphur, and oxygen from the air in the place of it) and oxide of iron; the sulphide of silver losing its sulphur in a similar manuer, whilst the silver and chlorine of the salt are placed on uniting terms.

No. 238.—Rich gold ore from the Petticoat mine, Railroad Flat, Calaveras County. Fine flake gold in a porous condition, from decomposition of iron pyrites. Also some beautiful minute crystals of pyromorphite (phosphate of lead) from decomposition of galena.

No. 239.—Chloride of silver from White Pine district, 120 miles east of Austin, Nevada. Yellow and purple impure chlorides, very heavy, and rich. A greenish coating on one of the specimens resembles dirty green carbonate of copper.

No. 240.—Gold quartz, showing parallel veinlets; Eureka mine, Amador County.

No. 241.—Rebellious ore from Volcano district, Amador County. Iron pyrites, and some beautiful brown zinc-blende.

No. 242.—Auriferous quartz from the Eagle mine, on the Mokelumne, near Clapp's Bridge. Iron pyrites, free gold, and barytes.

No. 243.—Auriferous arsenical iron and copper pyrites from the Pioneer mine, at Volcano, Amador County, worked by W. H. Thoss, and yielding $90 a ton by his process. Portion of the ore is honeycombed, and the surface has the appearance of peacock and horseflesh ore, (Bornite) where it has been long exposed to the action of the air, or to watery solutions.

No. 244.—Decomposed pyritiferous ore, from the Sulphurets mine, Pine Grove, Amador County, owned by Mr. Kendall, and rich in free gold.

No. 245.—Iron pyrites and galena, with specks of copper pyrites; from Soap Root mine, West Point, Calaveras County; assaying $150 per ton.

No. 246.—Beautiful quartz and gold, the latter of a slightly greenish tinge; from Church Union mine, El Dorado County.

No. 247.—Iron pyrites with free gold; brittle and mixed with granular quartz; from the Petticoat mine, Calaveras County.

No. 248.—Peroxide of Manganese; from Butte Mountain, Amador County.

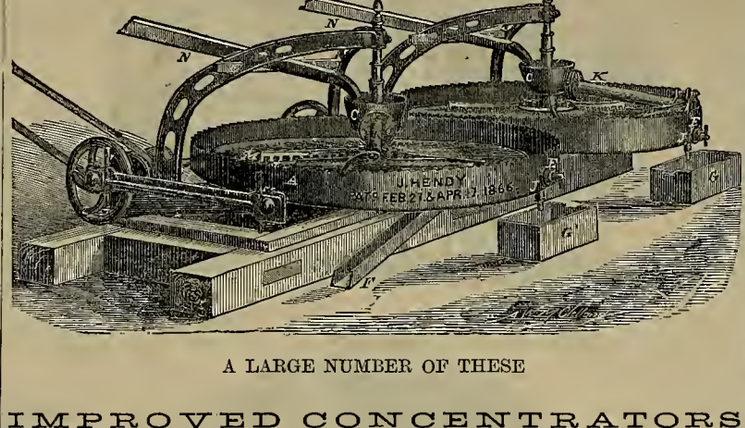
No. 249.—Pyrites and zinc-blende from Mahoney mine, Sutter Creek, Amador County.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the hundreds of inventors and patentees on this coast who have patronized us.

Dangers of Delay.



Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

To J. HENDY.

A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1805, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

ATTENTION.—Virginia City, Aug. 9th, 1868—Dewey & Co., San Francisco.—Gents:

The Patent, enclosing your favor with Inventor's certificate, etc., came duly to hand, and for which please accept my grateful acknowledgements.

I am pleased to learn that the business of your agency for Patents, etc., is rapidly increasing. This is as it should be. Your promptness, fidelity and skill, as Patent Agents, entitle you to public confidence and patronage.

I can see no good reason why Inventors on the Pacific Coast should employ agents in New York and other Eastern cities to transact their business at the Patent Office, when we have among us those equally qualified by long study and large experience.

Yours truly, J. A. C.

Work at the Foundries.

A glance at the work going on in the foundries of this city, will at any time furnish the reader with a better idea of the new and enlarging industries and developments of the State, than could be conveyed in any other manner in so brief a space. It is a peculiar impression that one obtains in looking for an hour or two through the black precincts of the iron artificers. So much sturdy and noisy activity, the shaping of such essential, and at the same time such complicated and massive pieces of machinery, out of a material so unmanageable and stubborn to the ordinary hand as iron, together with the general air about the foundries, which has its influence upon the visitor while the cause thereof cannot easily be described, combine to inspire the feeling that one is, here, in the very center of the toiling world, and in the midst of all the noteworthy things that are being accomplished between Puget Sound and Mazatlan.

Beginning with the foundries on Fremont street: at the Phœnix there is a great deal of wrought iron work being done for houses, and there are several new large Kittredge safes just completed, one of which is intended for the State Treasury at Sacramento. At the Atlas Works, they are engaged chiefly on boilers and miscellaneous cast iron work.

At the City Foundry, Clerc & Co. proprietors, there is in hand and about completed, the machinery requisite for the manufacture of cement pipe, intended for Martin & Co's pipe and pottery establishment at North Beach. Also a new patent mangler for a laundry; a sawing machine; an excavator; punching machines and shears for boiler-makers in this city, Stockton and Los Angeles; several steam engines; shutters and house fronts; horse-powers for different purposes.

A new hoisting machine for gravel claims and quarries, of peculiar merits and design, being the first of the kind, and made after the drawings of the inventor, Mr. McDonald, is completed and awaiting shipment. It is stronger, and raises heavier rocks than anything that has been heretofore constructed; but the best feature connected with it is an extra sliding horizontal beam which can be carried out, with the load at the end of it, from fifteen to twenty feet beyond the end of the common beam, so as to enable the operators to deposit the rock just where they want it. Manifestly this will save a great deal of hand work. It is to be operated by a six-horse-power engine.

At the Neptune Foundry there is in progress an apparatus consisting of several tanks, the object of which is to ripen wine; probably by the d'Heureuse's process.

At the Portland Boiler Works there are several large boilers under way for a new steamboat, which is being constructed at Humboldt Bay, for Mastick & Campfield, lumber dealers. The machinery for the steamer is being made by John Lochhead.

At Garratt's Brass Foundry are to be seen two very large old Mission bells, which were cast in Peru, in 1809. They came from the mission of San Juan, in Santa Clara Valley, and the object is to have them fixed so as to admit of being swung and rung in a civilized manner, in the place of suspending them by the ancient Spanish rawhides. Two large clear-toned church bells, weighing 850 and 450 pounds respectively, which were made for the Fair, are awaiting purchasers.

At the Vulcan Foundry, a great deal of important work is being done. There are two unusually large hydraulic presses approaching completion, intended to press seed cake for the Pacific Linseed Oil and Lead Works; the rams being 16 inches in diameter, and weighing nine tons. A very fine sorghum sugar mill, with rollers 16 inches in diameter and 24 inches long, is under contract with E. T. Steen for other parties.

A good deal of railroad work is done, chiefly in small orders which are coming in all the time, for the California Pacific Railroad, better known as the Vallejo road. The Ransome Concrete Stone Company are having a tank made of boiler iron, about 20 feet in hight and four feet in diameter, for the preparation of their silicate of soda under a pressure of about 20 pounds, which is found to accelerate the operation. A 27-inch Jonval turbine is just completed for Johnson's flour mill, in Tulare Valley; also a 5-stamp battery for a quartz mining company in Grant County, Oregon, and a 20-horse power steam engine for Allen & Ranney's sawmill, Santa Cruz.

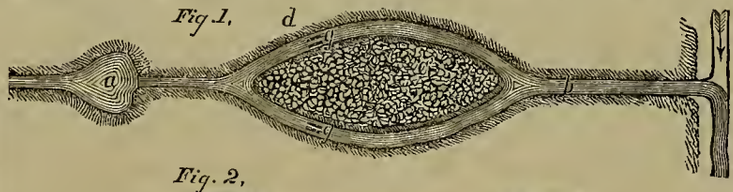
Operations at the Miners', Ætna, Fulton and other foundries, will be referred to hereafter.

How Gold Mining is Carried on in Japan.

An account is given by Raphael Pumpelly in the Smithsonian Contributions for 1866, of gold mining operations as they are carried on at Kunnui, in the island of Yesso, northern Japan,—where things are done by Japanese in their own peculiar manner, and in one of their own ancient gold fields. Mr. Atwood has favored us with the following condensation, from which, by the aid of the accompanying diagrams, the merits of the Japanese method will be readily comprehended. Pumpelly says:

Descending to the west we entered the valley of the Toshibetz, a large creek navigable with small flat boats, and soon reached the gold washings of Kunnui. This part of the valley occupies a broad depression, perhaps fifteen miles long by seven broad, and raised several hundred feet above the sea. It has been filled with

Fig. 1.



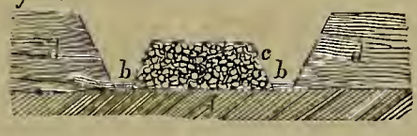


Fig. 2.

a recent terrace deposit, and subsequently eroded in part, after which an extensive deposit of auriferous gravel has taken place, over at least a considerable part of the area.

In one of the side valleys the older rocks are exposed, and here the gold-bearing drift was found resting, in different places, on an argillite similar to that seen at Washiuoki, and containing the same vermiform fossils, in strata striking N. 85° W., and dipping 50° northerly, and on an amygdaloid similar to that on the Divide. Not far from here the terrace deposit overhangs the creek in a high bluff. Out of the base of this precipice I obtained a number of well preserved fossil shells.

The principal rocks that have contributed to form the auriferous drift, are varieties of granite, chloritic and micaceous chists, quartzites and amygdaloid, with geodes of chalcedony from the last mentioned rock.

Rolled fragments of binoxide of manganese are frequent, also perhaps derived from the amygdaloid. The concentrated sand of the washing is principally magnetic iron, associated with zircon sand.

The manner of working the deposit is ingenious, and will be understood by referring to the diagrams.

At the place where I saw this process, the surface of the bedrock, in this case the marine terrace deposit was sufficiently high above the creek to give a rapid fall in the sluice-ditch.

The bed of a rivulet is chosen for the work. A reservoir *(a)* is dug and dammed, and the bed of the rivulet *(b)* cleaned out and made regular. This done, the banks *(d)* are broken down into the stream where the force of the current concentrates the gravel, carrying off the sand and clay. The workmen then place themselves in pairs up and down the stream near and below the broken down bank. Each man is provided with a coarse mat, about two feet long by one foot broad, which he places lengthwise in the stream, keeping it down with one foot on the lower end, at the same time partially stemming the current. He then hoes the gravel on the mat, much of the old gravel going off below as fresh arrives from up stream.

At intervals the mat is carefully removed and washed out into a very shallow tray or batea, a board about eighteen inches long by a foot broad, hollowed out, and having a circular depression near one end, for the concentrated head. Of the black sand obtained on this board, the head containing the gold is saved.

In this manner the gravel is pretty well exhausted of its gold, very little being obtained by the men further down the stream. The working process is sideways into the banks, and up stream, the current being kept near the banks as these recede from the center of the stream. As the space between the banks widens, the coarser materials that resist the force of the water is thrown up into a pile of loose masonry *(c)* which increases in length and breadth as the work advances.

REPORTORIAL ACCURACY VS. GEOLOGY.—A New York city item represents that a sensation was created among the up-town people of New York, the other day, by the discovery of the perfect remains of a human foot and leg, embedded in some granite which the quarrymen are blasting at the corner of Tenth avenue and Forty-second street; the granite being of a pale color, and the human remains perfectly black. Geologists have been in the habit of regarding granite as the most ancient of all known rocks, though later observations have established its occurrence subsequent to the first records of animal life. The latest authenticated occurrence of granite is in dykes amongst the Jurassic rocks of northern Italy. The fossil Bowers man of Calaveras is "nowhere" by the side of this alleged Rip Van Winkle.

GRAND BAL MASQUE.—As the Carnival Ball, given for the benefit of the Mechanics' Institute, proved a success, giving such entire satisfaction to all in attendance, a genuine Bal Masque has been determined upon at the same place, under the management of Mr. Henry Bering, to come off on Thursday evening, Oct. 15th. All intending to participate are requested to appear in costume or domino, and can remain incog. during the entire evening if they so desire.

CONTINENTAL Life Insurance Company, 202 Montgomery street, corner of Pine.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Mining in Amador County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from page 199.]

AMADOR CITY.

Only one mine is now in operation at this point, viz.: the Keystone, owned by James McDonald, Michael Reese, and others of San Francisco, and superintended by Mr. S. Moore, of this place. On this mine the company have sunk some 400 feet and upwards. Their pay rock ranges from twelve inches to ten feet in width, and yields from $12 to $15 per ton. The ore is heavily sulphureted, assaying on an average $250 per ton. They get them worked at Jackson. The company are working their mine by two shafts, with steam hoisting works to each. They also have a steam mill of twenty stamps, concentrating their sulphurets in Hungerford's old patent, and amalgamating their free gold in battery, copper plates and pans,—a process, by the way, which appears rather antiquated, but they say they make it pay, how cheaply or largely, the writer knoweth not.

THE SPRING HILL MINE,

(J. Perkins & Co.) are repairing their mill of thirty-one stamps (water and steam power), expecting to start again soon. They are down on their lode some 400 feet; have from five to forty-five feet of quartz, and a pay streak ranging from six to nine feet. The ore is low grade, and estimated at about $10 per ton. Mr. C. W. Smith has charge at present.

North of the above place, on the main belt, nothing is being done; everything is suspended until reaching El Dorado County, in the vicinity of the Havilah mine.

SUTTER CREEK.

At this place exists the main enterprise of the county. There are five or six mines now working in this immediate vicinity, but it is questionable whether any of them are paying, except the Amador. The Lincoln, owned by Leland Stanford, Downs, and others, are working rock thirty feet below the surface; it pays $10; have a 20-stamp mill (water power); save in battery, shaking tables, and copper-colored copper plates. Mr. Downs, the Superintendent, thinks his process of saving so near perfection that it is useless to apply any of the later improvements. The "old way" suits him, whether it pays or not. In fact, the same remarks will truthfully apply to this entire district, not excepting the Amador mine, although nobody has been so frank to acknowledge it as Mr. Downs has. The Mahoney mine, owned by Mahoney Bros., are somewhat extensive in their operations. Judging from the appearance of the ore, I should think the mine could be made to pay largely if conducted on correct principles. The owners are workers, and apparently are satisfied with merely round wages. They have two shafts sunk on their mine, distant 100 feet from each other. The old shaft is down 400 feet, where the ore is eight or nine feet wide; the new shaft is only 200 feet in depth, and shows a 20-foot vein. One is run by whim, the other by steam. They have two mills (water power) one fifteen, the other twelve stamps, crushing on an average twenty-five tons per day.

The Railroad mine, C. Belden, Superintendent, are working; down 385 feet; have a 2-foot vein; rock supposed to pay $19 per ton.

A San Francisco company are sinking a prospect shaft on the Summit, south of the Amador mine. Indications for a mine appear to be efficient to warrant sinking to a considerable depth. This is owned by A. Tibbits, of Sutter Creek, and McAllister and others of San Francisco, who are supposed to be on the Amador vein, about 1,200 feet south of the Badger shaft. They are now down 115 feet, finding nothing but boulder and gouge as yet; is easily worked, costing only $12 per foot, including timbers.

AMADOR MINE.

The history of this mine being so well known, a mere outline at this time will be sufficient. It is owned principally in San Francisco; Michael Reese at present being the largest shareholder. Mr. Richard Inch, of Sutter Creek, is the acting Superintendent. This mine is composed of the old Eureka and Badger, consolidated. They are on one and the same vein, and are now connected by a 930-foot level. The company are working three shafts; the south or Badger shaft,—from which they are taking $100-ore,—is sunk to the depth of 1,100 feet; vein from three to four feet, and rapidly increasing in width. Three hundred feet north of this, is the middle shaft on the Eureka, which is down 1,000 feet. This, in connection with the north shaft, seventy feet farther north, which is 1,215 feet in depth, and having a 1,200-foot level, tap s an immense body of low grade ore, yielding an average of $10 per ton free gold, exclusive of sulphurets; which, by the way, are rich, and save in their rude manner of concentrating, about two tons per day from eighty tons of ore; this amount being the crushing capacity of the three mills running—all told—seventy-two stamps. This mine is said to comprise what is termed the "Boulder" and the "Gouge" veins, the two principal parallels forming the main belt, extending through the county; but at this point, and in this mine only, do they come together. The yield of this mine is, and has been truly wonderful. It is estimated that one man (Mr. Hayward) has taken out at least six millions of dollars, saying nothing of the hundreds of thousands supposed to have gone down the creek in the form of sulphurets and amalgam along with the tailings. In the opinion of the writer, their process is susceptible of vast improvement.

JACKSON AND VICINITY.

Two miles north of this place is situated the Oneida mine (N. Y. Co.) James Morgan, principal owner and Superintendent. This mine is extensively worked, and that, too, under the immediate supervision of a thorough bred miner. This company are down on their ledge 500 feet, and have from six to thirty feet of quartz. The ore is of a low grade, the highest average of a run being $17.50 per ton. They have a large mill (steam) running sixty stamps, and are now using twelve of Hungerford's latest improved concentrators, which work beautifully, and are entirely satisfactory to the Superintendent. Mr. M. is constantly studying and reducing to practice, economy in handling and working his ores. In the matter of fuel, he has secured a coal mine at Ione Valley, ten miles distant; this he is now using successfully, effecting thereby a saving of at least 50 per cent. in cost of fuel. The coal or lignite vein is seven feet thick, and is taken out at scarcely no expense in mining. The whole cost per ton, delivered at the mill, does not exceed four dollars. It burns beautifully, and seems to fill the bill in every particular.

The Kennedy mine is owned by Fleming Fuller, and others. They are down 250 feet; vein from three to eighteen feet in width. From its past history, it is considered the richest mine in this whole vicinity, usually averaging $20 per ton. The company are now erecting a 20-stamp mill, and will get to running during the present month (September).

Messrs. Coney & Bigelow have a six to twelve foot ledge; are down 300 feet; ore heavily sulphureted, which assays $160 per ton; have a 26-stamp mill (steam power) and are using Hungerford's old patent for concentrating sulphurets, in connection with two hands with hoes, and another with a wheelbarrow. Taken altogether, this process is nearly equivalent to Hungerford's improved, or Paine & Stephen's patent. This company have, however, in a measure, redeemed themselves by erecting chlorination works of about five tons capacity for twenty-four hours. Here they not only work all of their own sulphurets that they can save, but purchase and work a great deal for other parties. This branch of the institution is evidently making money. During the first three months' work, they took out over $16,000.

The Hardinburgh mine, the writer was unable to visit; learned, however, that they very recently struck it rich, and that they are highly elated with their prospects.

At Volcano, very little is doing in quartz at present, although placer mining,—in the hands of Italians, mostly,—is very good. The Italian quartz mine (Sorocco Bros.) have quite recently struck some very rich rock. The Pioneer ledge is leased by the Sorocco Bros., who get their ore (which is very rebellious) worked at W. H. Thoss' mill. This mill is simply an overshot wheel, a rock crusher, and two 10-foot pans or arastras. With this machinery, Mr. Thoss works any ore they fetch, no matter how refractory, up to within five per cent. of fire assay, and occasionally as close as two per cent., and at a cost not to exceed six dollars per ton. Probably not a mill in the State could take out five dollars on the same ore, except by chlorination. Mr. T. does not concentrate, but works all the rock, thereby saving a heavy percentage lost in concentrating. With his mill as it is, he works nearly 3½ tons per twenty-four hours. His pans are formed with heavy iron bottoms, and a light lining of iron on the sides. It is rigged arastra form, using heavy drags of basaltic rock, and running about twenty-five revolutions per minute. The writer witnessed the working of a batch of ore (eight hundred pounds). This was ground only four hours, when a clean up, occupying only fifteen minutes time, was made; the result was 17½ ounces of dry amalgam, worth two dollars per ounce, or $35. This statement may seem incredible, but one thing is certain, that Mr. Thoss is making money, and cares not particularly, so far as he himself is concerned, whether the community believe it or not. He works nothing but what others cannot work; all he requires, is to have the rock assay well, and at a cost of six dollars per ton he will work within five per cent. Those who doubt are privileged to take his tailings and make their own assays.

ABOUT PINE GROVE

there is some fair looking quartz. Mr. Kendall has a mine called the Sulphurets, that looks very well. Free gold is quite visible through a considerable portion of the rock. There are many other leads in this vicinity that look well; all that is required, apparently, is capital and good management to make them paying mines.

B.

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

[Continued from page 223.]

Whilst on the one hand, the zones formed in the earth are considered to have possessed a somewhat stable or permanent character, those formed in the atmosphere would, on the contrary, be the reverse; for no sooner had the gasiform products forming them, by, in the first instance, obeying the impulse of gravity, and so overcoming the counteracting tendency of the laws of the diffusion of gases, than these latter would assert themselves, and in process of time entirely obliterate this arrangement.

In the first instance, however, we should have the atmosphere next the earth composed of a dense vapor of those compounds volatile only at a high temperature, amongst which the vapor of chloride of sodium or salt would be probably one of the most prominent. Above this we should find the carbonic acid, then oxygen and nitrogen, whilst the vapor of water would be elevated still higher. As before stated, such an arrangement would be gradually obliterated by diffusion, but as the element of time is one of vital importance for considering the effects of diffusion, it is imagined that before being obliterated this arrangement may possibly have had considerable influence in modifying the chemical reactions which took place at this period in the earth's history.

The effect of the cooling of such an atmosphere would be, in the first place, to condense the vapor of salt and other chlorides, etc., upon the already solidified crust of the earth, covering it with a layer of these substances in a solid state, the chloride of sodium in which has been calculated to have alone been sufficient to clothe the entire sphere with a coating of salt some ten feet in thickness.

A still further reduction in temperature would now condense the steam in the atmosphere, which falling as rain on this saline crust, would, in greater part, dissolve it, forming the ocean, which would thus be salt from the first moment of its appearance on the face of the globe. The atmosphere now surrounding the earth would contain much less oxygen, and all the carbon in the form of carbonic acid (excepting only the amount of that acid carried down with the rain), but otherwise would probably not differ much in composition from what it is at the present moment.

Regarding the above as merely a sketch, in the main correct, I would, however, remark that it would be absurd to attempt to define, with any sharpness, the exact action and extent of the reactions, or to insist that the entire amount of any one element entered only into one particular state of combination, to the exclusion of all other reactions, which might have been influenced by circumstances, amongst others, of position and time. My meaning may be best explained by an experimental illustration. If we suddenly throw a little sulphuric acid into a solution containing both lime and baryta, the precipitate which is at once thrown down is not pure sulphate of baryta, but an indefinite mixture of the sulphates of baryta and lime; for the sulphuric acid immediately seizes upon the earths nearest it at the moment, and before it has time to obey its superior affinity for baryta, it is carried out of the field of action as a precipitate of mixed sulphates.

I will now enter into a consideration of the arguments which are brought forward in opposition to this view.

It is advanced, in the first place, that the chlorine, instead of uniting with the sodium, as supposed by me, would have combined with the hydrogen and gone into the atmosphere as hydrochloric acid. Believing that the hydrogen would have united with the oxygen to form water, I also contend that the affinity of sodium for chlorine is greater than for hydrogen, since sodium, both in the cold as well as hot, decomposes hydrochloric acid, whilst, on the contrary, hydrogen, whether cold or hot, does not affect chloride of sodium.

It is further advanced that the sodium really united with oxygen to form soda, which would be converted into silicate of soda by the mutual reactions between soda, steam, and silica. In this explanation secondary reactions are dealt with, instead of primary, which are supposed to be specially characteristic of this stage in the world's history. It must also be remembered that carbon, at a high temperature, reduces soda, and that the volatility of sodium would bring it in contact with chlorine in the atmosphere, whilst the silica remained below in the earth's mass in the solid form at this temperature. A portion of the sodium is, however, admitted by me to have combined with oxygen, and to have subsequently become silicate.

Against my supposition that the sulphur mainly united with the denser metals to form sulphides which at once sunk through the still fluid external zone of silicates, and so became protected from oxidation, it is contended that the sulphur would have united with oxygen and gone into the atmosphere as sulphurous acid. Here it must be remembered, however, that this reaction took place in the presence of a vast amount of hydrogen, carbon, silicon, phosphorus, etc., along with alkaline and earthy metals, all ready to seize the oxygen, and capable of decomposing sulphurous acid if formed.

Sulphurous acid is decomposed by the other metals at an elevated temperature, with the production of oxides and sulphides of these metals, as also by carbon, with the greatest ease, with the separation of sulphur (the subject of a patent taken out by Gurlt some years back for the recovery of sulphur from the fumes of metallurgical works). In addition to all this it must not be forgotten that the atmosphere then contained an overwhelming amount of carbonic acid and nitrogen, which would both act as a shield against oxidation, as well as dilute, if not entirely prevent, the effect of any strong oxidizing action, this being proved by the comparatively small amount of oxygen present in the atmosphere of this epoch.

In considering that the center nucleus of the earth must contain a vast accumulation of the denser metals and their compounds, I have done so for the following reasons:

The mean specific gravity of the earth is proved to be about 5·4, and, leaving the water out of consideration, the mean density of the solid exterior with which we are acquainted cannot be assumed to be higher than 2·75; it follows, therefore, that the internal portion of the earth must possess an immensely greater density than the exterior.

This has been explained by supposing that the increase in density towards the center arose entirely from the increased pressure, but experimental inquiry does not appear to warrant a conclusion which would require that even the most solid and compact rock we know at the surface should be (if found at the center of the earth) condensed into a mere fractional part of its volume; for, so far as experimental inquiry has gone, it has tended to show that after a certain point bodies either attain a maximum density or that the condensation bears a less and less ratio to the increase in pressure employed, thereby indicating the necessity of seeking for other explanation than the mere mechanical effects of pressure, in order to account satisfactorily for the great density of the earth's interior.

A simple calculation will show that if we regard the mean specific gravity of the earth as 5·44, and that of the external zone or crust as 2·75, and imagine that the earth is composed of three concentric layers of equal thickness, and of densities increasing respectively in arithmetical progression, there would be respectively an outer crust of specific gravity 2·75, an intermediate one of 10·82, and a central kernel, or nucleus, of 18·89; and if, instead of three zones, more than this number are imagined, then a similar calculation will show that the specific gravity of the central nucleus will be still higher.

Mechanical.

THE EFFECT OF THE ENVELOPE UPON A CHARGE OF POWDER.—This is a subject not yet fully understood. Many engineers have considered that the charge necessary to produce a certain effect should be calculated over and above the amount necessary to burst the box or other vessel used to receive the charge. Others oppose this view. *Engineering* has the following upon the question:

"That a very slight envelope suffices in some cases to influence the effect of a charge of powder is proved by the result of an experiment made some forty years since by the French general Pelletier. Fifteen kilogrammes of powder were placed upon a table and ignited. The gaseous products expanded freely in the surrounding air, and a very slight indentation of the table and a loud report were the only results. The same quantity of powder was again laid on the table, and covered over with a thin sheet of letter paper. The charge was ignited and the table was blown to pieces. Here the effect was, of course, due to the atmospheric pressure acting on the surface of the paper, and preventing to a certain extent the expansion of the gas. In practice it would seem that to produce any appreciable effect the envelope must be excessively strong, as in the case of shells. The Austrian Engineer Commission appear to have adopted this view of the case, for we are told they have recommended the employment for field service, of a *baril foudroyant*, for the destruction of stockades, walls, etc., and particularly of the iron railway bridges which play so important a part in modern lines of communication. It is described as a solid case of Bessemer steel charged with thirty kilogrammes of powder, and it is said to have produced the total destruction of a vault of masonry three feet in thickness.

In the present day, when gunpowder appears likely to be replaced (in engineering operations at least) by other compounds far more sudden in their mode of action, it is possible that a more careful study of the envelope question may lead to valuable suggestions."

INGENIOUS HEAT REGULATOR.—The following neat device for securing an equable temperature in hot houses or other buildings where it is desirable, is described as a recent English invention. A platinum wire is so inserted in the bulb of an ordinary thermometer, as to be in connection with the mercury. Another wire is so arranged as to be easily brought in contact with any part on the graduated scale of the thermometer. The two wires are connected with the two poles of a battery; and forming part of the circuit is an electro-magnet, whose armature controls the opening or closing of a valve regulating the admission of hot air. If it is desirable that the temperature of the room should not rise above 60° Fah., the point of the movable platinum wire is brought to that number on the thermometer. When the mercury registers 60°, the circuit is closed, and the armature of the magnet closes the hot-air valve, until the temperature becomes reduced, when the valve is again opened. Thus a nearly even temperature may be maintained.

HOT JOURNALS.—Water, when used as a lubricator for journals, does not act in the manner in which oil acts. In fact the friction is greater with water than with oil; but, by boiling at 212°, it keeps down the temperature, and thus prevents friction. It carries off the heat in a latent state, in the form of steam. Generally, *cold* water may be used; but if the journal be already very hot, the water must be used *hot* at first, lest the sudden cooling cause splitting of the plower-block.

TO BREAK LARGE MASSES OF IRON.—The following method is given by an English engineer: A hole, say an inch in diameter, is bored in the mass, somewhere near its center of gravity. This hole is filled with water, and closed with a smooth iron stopper. The latter is then brought under the iron ram and driven in by one stroke, by which, as there is no escape for the water, the mass is fractured.

Limit of Pressure Between Rubbing Surfaces.

We take the following from an article on "Bearings" in a recent number of the *American Artisan*:

The common law of the simple proportionality of friction to pressure is only true for dry surfaces when the pressure is not sufficiently intense to indent or grind the surfaces; and for greased surfaces when pressure is not sufficient to force out the unguent from between the surfaces, where it is held by capillary attraction. If the proper limit of intensity of pressure be exceeded, the friction increases more rapidly than in the simple ratio of the pressure. That limit diminishes as the velocity of rubbing increases, according to some law which has not yet been exactly determined. The following are some of its values deduced from experience: For railroad car-axles, with a rubbing velocity of one foot per second, the limit of pressure is 400 pounds per square inch; for two and one-half feet per second, 225 pounds; for five feet per second, 140 pounds; and for timber ways for launching ships, about 50 pounds. According to Bourne, if the pressure exceeds 800 pounds per square inch upon the section of the bearing in a direction parallel with the axis, the oil will be forced out, and the bearing will necessarily heat. He also gives the following empirical rule, which has been derived from observations made upon bearings of different sizes and moving with different velocities, for determining the limit of pressure which will be safe in practice; or, with a given pressure, for determining the limit of velocity: "Divide the number 70,000 by the velocity of the surface of the bearing in feet per minute. The quotient will be the number of pounds per square inch of section in the line of the axis that may be put upon the bearing. Or, if we divide 70,000 by the number of pounds per square inch of section, then the quotient will be the velocity in feet per minute at which the circumference of the bearing may work." It may be well to mention that, in making calculations upon the area of cylindrical bearings, it is not the cylindrical surface, or circumference of the bearing multiplied by its length, that is to be considered, but the greatest rectangular cross-section, or length of the bearing multiplied by its diameter.

SIZE OF IRON BAR TO SUPPORT A GIVEN WEIGHT.—To find what should be the dimensions of a bar of square iron to support a given weight, divide the weight in tons by five, extract the square root of the quotient, and the result will be the length of the side in inches. Example: What should be the length of the side of a square bar to support twenty tons? Answer: two inches. So with any rectangular bar not square; if either the breadth or thickness be given, divide the weight by five times this dimension, and the result will be the other one. To find the weight which a rod of given diameter will support, square the diameter in inches and multiply by four. The product will be the safe working load in tons. Thus, a rod three inches in diameter will safely support thirty-six tons. We condense the above from *The Engineer*.

NEW IDEA FOR STEEL RAILS.—The objection to rails entirely of steel is their great cost. The objection to those which have a top surface only of steel, is the liability of that surface to peel off. A London journal says that Mr. Peter Ashcroft, Engineer of the South Eastern Railway, has invented an ingenious contrivance for using the least steel in rails, while presenting only a steel surface to the wheels, and enabling renewals to be readily effected. "He introduces between a pair of iron plates a steel rail, which fits in between the iron plates, the steel being tightly secured by screwing the iron plates up. The trains work only upon the steel, and when it is necessary to renew it, it is done by simply unscrewing the iron plates, taking the old steel rail out, and putting a new one in. We hear the plan is working extremely well on the Charing-Cross line."

A FINELY constructed stone bridge is being put up at the crossing of Humboldt, eight miles below Oreana, of granite obtained from O'Connor's quarry, near Humboldt.

Scientific Miscellany.

THE DEVELOPMENT THEORY.—The July number of the *Popular Science Review* contains a lecture by Prof. Huxley, on the fossil links between the families of birds and reptiles. We quote a portion of the conclusion:

"I have now, I hope, redeemed my promise to show that, in times past, birds more like reptiles than any now living, and reptiles more like birds than any now living, did really exist. But, on the mere doctrine of chances, it would be the hight of improbability that the couple of skeletons, each unique of its kind, which have been preserved in those comparatively small beds of Solenhofen slate, which record the life of a fraction of Mesozoic time, should be the relics, the one of the most reptillian of birds, and the other of the most ornithic of reptiles. And this conclusion acquires a far greater force when we reflect upon that wonderful evidence of the life of the Triassic age, which is afforded us by the sandstones of Connecticut. It is true that these have yielded neither feathers nor bones; but the creatures which traversed them when they were the sandy beaches of a quiet sea or lake, have left innumerable tracks which are full of instructive suggestion. Many of these tracks are wholly indistinguishable from those of modern birds in form and size; others are gigantic three-toed impressions, like those of the Weald of our own country; others are more like the marks left by existing reptiles, or *Amphibia*. The important truth which these tracks reveal is, that, at the commencement of the Mesozoic epoch, bipedal animals existed which had the feet of birds, and walked in the same erect or semi-erect fashion. These bipeds were either birds or reptiles, or more properly both; and it can hardly be doubted that a lithographic slate of Triassic age would yield birds so much more reptilian than *Archæopteryx*, and reptiles so much more ornithic than *Compsognathus*, as to obliterate completely the gap which they still leave between reptiles and birds. * * * In conclusion, I think I have shown cause for the assertion that the facts of Palæontology, so far as birds and reptiles are concerned, are not opposed to the doctrine of evolution, but, on the contrary, are quite such as that doctrine would lead us to expect; for they enable us to form a conception of the manner in which birds may have been evolved from reptiles, and thereby justify us in maintaining the superiority of the hypothesis, that birds have been so originated, to all hypotheses which are devoid of an equivalent basis of fact."

EFFECT OF INTENSE GALVANIC CURRENTS UPON WIRE.—Mr. James Wylde says that if intense currents are passed through wire *in one direction only*, its tenacity is gradually destroyed, so that at last it may be crushed in the fingers. His experiments show that a complete molecular change occurs; and this in the greatest degree at the negative pole. A crystalline structure takes the place of the fibrous. This change is prevented by a frequent reversal of the current.

PARAFFINE.—Bolley has found that paraffine fusing at 53 degrees Centigrade and having the composition — carbon, 85.61, hydrogen, 14.69,—when exposed to air, and heated to 150 degrees, Centigrade, for eight days, becomes at last changed into a tough, doughy, blackish mass. Part of this is unaltered paraffine soluble in absolute alcohol; but after the removal of this a dark brown residue, of carbon, 70.04; hydrogen, 10.25; oxygen, 19.72, is left. Paraffine is probably a mixture of various hydro-carbons, with various boiling and melting points.

ELECTROLYSIS OF WATER.—M. Bourgouin, in a recently published paper upon this subject, asserts that the acid or alkali which is added to the water to make it a conductor, does something more. When potash was employed, he observed that the amount of hydrogen disengaged was always proportional to the amount of potassium carried to the negative pole, and his opinion is that it is a hydrate of potassium $K HO^2$ which is decomposed. Similarly, in the case of water acidulated with sulphuric acid, he believes that a hydrate $S H' O6$ is the body electrolyzed, and that the excess of water takes no further part in the action than to continually replace that removed from the compound named.

ANTIQUITY OF MAN IN NORTH AMERICA. In the reported proceedings of the American Association for the Advancement of Science, which met at Chicago in August last, we find mention of a paper which was read by Mr. J. W. Foster upon the above named subject. After discussing the conditions under which human remains had been discovered in Europe, he took up the question of the mound-builders of our own continent. He considers them to have been in advance of the stone age men in Europe. He exhibited two specimens of pottery from near Belmont, in Missouri; and pointed out the difference between the features of the human face represented upon one of these and the features of the North American Indians. The other specimen, probably a statuette, gave evidence of considerable advance in the sculptor's art; the arms being represented as bound to the trunk by cords, as if it were a captive, and the features bearing an expression of pain. He conceives that the excavations at Lake Superior which must have been made by this same people for mining purposes, are at least a thousand years old.

Want of space compels us to defer to next week a more extended notice of the discussion which took place upon this subject.

PETROLEUM—PENNSYLVANIA AND CALIFORNIA.—At the recent meeting of the National Academy of Sciences, Prof. Whitney read a paper by Prof. Peckham, giving his idea of the source of both the Pennsylvania and California petroleums. He considers the latter of animal origin, and not, like the former, the product of the decomposition of woody fiber, or of the natural distillation of shales and soft coal. He says:

"The small amount of nitrogen present in the Pennsylvania oils does not make their origin from plants impossible; but when one comes to the later oils of California, so much nitrogen is present as to render the decomposition of the petroleum analogous to putrefaction of animal flesh. Theoretical formulæ, showing how stearic acid, and the stearate and oleate of glycerine might easily be changed into the oils or hydrocarbons, were presented. Profeine, when subjected to decomposition, submerged in water, would give rise to a nitro-hydro-carbon like the California oils. At one locality in California the boring penetrated several feet through a mass of fossil bones, saturated with the fluid. The liquid retained for several days the cellular structure of bone, but finally lost its organic structure by exposure. If it be objected that a petroleum derived from animals ought to contain phosphorus and sulphur, it may be clearly shown that the aqueous conditions of decomposition will remove both the elements as soluble compounds, and scarcely any traces of them be left behind. Petroleum was hence divided into two classes: the first contains paraffine, and forms asphaltum by inspissation, or absorption of oxygen from the air; and the second contains no paraffine, and forms asphaltum by decomposition. The first are the liquids from Oil Creek, Pennsylvania, the second are well represented by the petroleums of Southern California. The latter are not held in natural reservoirs, as in Pennsylvania. The strata are tilted at every angle, and the fissures are of limited extent, so that the oil is really kept in place by capillary attraction. The wells bored there have varied from 50 to 400 feet in depth."

ASSAY OF IRON ORES.—A writer in the *Chemical News* gives a hint which is worth the attention of those who make analyses of ferruginous minerals. He says: "On attempting to dissolve in HCl, a certain residue remains (with hematite ore, for instance); and it is rather a long process to have recourse to fusion with sodic carbonate to separate the silica and iron. I tried fusion with bi-sulphate of potassa at a dull red heat, which converts the iron into a sulphate, leaving the silica beautifully white. The time is, for one grm. of mineral, about ten to fifteen minutes. Should sulphur and phosphorus be required, they may be obtained by drenching a sample with fuming nitric acid, and manipulating in the ordinary manner. The residue may then be treated with bisulphate, to separate the remainder of the iron from the silica."

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week Ending September 22d, 1868.

82,277.—Improvement in Spark Arrestors for Steam Generators.—Walter C. Benn, San Francisco, Cal., assignor to self, L. L. Baker and R. Hamilton, of same place:

1. I claim the stack or chimney A, with the curve *a*, as shown, and the water vessel C, together with the supply and discharge pipes b, b, and d, the whole constructed and arranged substantially as herein described.

2. The secondary bonnet D, and the annular water trough E, ae arranged for more completely extinguishing the sparks, substantially as described.

3. I claim the conical vessel C, and bonnet D, movable in the slides *c*, *c'*, *c*, for regulating the draft, the whole constructed and arranged substantially as herein described.

The object of this invention is to arrest the sparks that are forced into the smoke stacks of steam generators, and to extinguish them before they escape. Many devices having this object in view, have been patented, but most of them do their work imperfectly. The construction of the smoke-stack in this device is such that the sparks are caught by a curve at its top, and fall into a conical vessel filled with water, which is suspended inside the smoke stack, immediately below the curve. The conical vessel is so arranged on slides that it may be moved up and down, to regulate the draft, and pipes are so disposed at the bottom and top that it may he filled with water, or the water and cinders drawn off by simply turning a cock. To arrest any sparks that may have escaped an annular trough, also filled with water, is placed around the top of the stack, and a honnet, which may be raised or lowered, surmounts the whole, thus effectually preventing any of the lighted cinders or sparks from escaping.

82,278.—Improved Mill Stone Balance. Walter C. Benn, San Francisco, Cal., assignor to self, Livingston L. Baker and Robert Hamilton, of same place:

I claim the combination of the adjustable weights D, D, and the ways C, C, together with the operating screws E, E, and the elevating screws *b*, *b*, or an equivalent device when used for balancing mill stones, the whole constructed and arranged substantially as herein described.

Balancing mill stones is one of the most tedious and perplexing tasks of a miller, as it is necessary that both their standing and running balance should he perfect, since otherwise the grinding surface will not be even and regular enough to produce good flour. In this invention that result is accomplished hy placing inside of the box which surrounds the stone, four weights, which lie opposite the driving point in the center of the stone, and slide in ways, along which they are moved by set screws operated from the outside on the verge or circumference of the box,. The balance is obtained by moving these weights, by means of the screws, toward or from the center and up and down, as may be necessary, until the true balance is obtained.

82,291.—Improved Belt Buckle.—Francis Clausen, San Francisco, Cal.:

In a belt buckle, I claim the bevcled projecting lip B, in combination with the elotted bar C, rotating on its axis, as shown, and the operating level b, the whole constructed and arranged substantially as and for the purpose described.

The object of this invention is to provide a lady's belt buckle that will retain the movable end of the belt without the necessity of piercing it full of holes and thereby destroying it. The end of the helt is held by being placed between the protruding beveled lip and the slotted bar; when the bar is forced down past the projecting end of the lip, the belt is firmly without the aid of teeth.

82,312.—Improvement in Hens' Nests.—B. F. Hayward, Nebraska City, Nebraska:

I claim the nest box C, pivoted bottom board D, link *b*, levers E, and grating *d*, all constructed and operating substantially as described within a box A, all as set forth.

82,315.—Improved Process of Extracting Precious Metals from Ores, Etc.—Geo. P. B. Hill, Virginia City, Nev.:

I claim the ingredients above enumerated mixed or compounded, and added to the ores, pulp tailings and slimes, in about the proportions herein specified for the purpose set forth.

82,320.—Improved Wood Pavement.—D. W. Hunt, San Francisco, Cal.:

I claim a pavement, the blocks of which are secured in position hy means of cement run into horizontal grooves or recesses cut around each block, the blocks and grooves being formed and arranged substantially as described.

By this patent the inventor has secured a very simple and economical method of constructing and laying wood pavements, either for streets or side-walks. The blocks are made square, and each one has a groove cut around it horizontally near the center of its depth, so tbat the open spaces of the different blocks are all connected. These spaces are connected with the upper surface of the pavement by means of openings formed by laying the blocks so as to break joints, and the spaces are then filled with asphaltum, which serves to hind the whole together, thus forming a pavement at once elastic aud permanent.

82,321.—Improvement in Oil Cup.—Edwin Hurd, Virginia City, Nev.:

I claim the arrangement of the frame E, the hollow cylinder *a*, pivoted within it and having passages for the reception of oil, for the escape of air, and for the delivery of the oil through the pivots on which it turns substantially as described.

This invention relates to an improved lubricating cup to be used more especially in steam-chests and cylinders, or in any place where the lubricant is to be introduced against pressure; and it consists of a partially rotating cylinder, standing between the receiving cup and the point at which the oil is to be used. The cylinder has an opening at the top corresponding with one from the receiving cup, when in one position, and when the cylinder is rotated to another position, a holo in the bottom allows the oil to flow to its destination, the upper opening being meantime closed by turning the cylinder to its new position, and thus relieving the upward pressure of the steam. The cylinder turns on peculiarly shaped pivots at either end, supported in a frame so as to he easily kept steam tight, and having but little wear, and it cannot be operated wrongly by the most ignoraut.

82,350.—Improved Track Laying Machine for Railroads.—Wm. D. Robertson, San Francisco, Cal.:

1. I claim as a new application to construction trains, for supplying power to carry forward from the rear car to the place of deposit, the rails aud ties, the engines *a*, *a*, mounted ou the central car, substantially as described.

2. The shaft f, with the screw g, actuating the trucks b, b, by the beveled gear k', 1', or their equivalents, substantially. as described.

3. The pulley *u*, on the rear truck axle of the engine for driving the friction rollers which carry the ties to the incline trough beneath the boiler of the engine, substantially as described.

4. The friction rollers *t* and *u*, in combination with the channel or trough V, substantially as described and for the purpose specified.

5. The pulleys g', and the helts W and W', or equivalent devices for actuating the cutters, substantially as described.

6. Carrying the rails forward at each side of the boiler and lowering them to the road bed by the davits A, A, substantially as described.

7. The rollers g, g', r, r', s, s, s, s, the endless chains p, p, or equivalent device for pressing down and holding tho ties while the cutters trim them, substantially as described.

8. The cutters V, V, for leveliug and trimming the ties to receive the rails constructed and operating substantially as described.

This invention relates to the manner of loading the ties and rails for railroad tracks, on common platform cars, of hauling forward the loads from one car to another, and up to the rear end of the machine, the passing of the material, the ties and rails, from the rear of the machine to their respective places forward, and preparing the track for the passage of trains over it. This machine, which has been for some time successfully at work on the new railroad from Vallejo to Sacramento, has been fully described in the Press.

82,440.—Improvement in Fastening for Buttons.—Alfred Rix, San Francisco, Cal.:

I claim the headed shank and open washer for securing the button to the cloth or garment, constructed substantially in the manner and for the purpose set forth.

Reissues.

3,137.—Improvement in Anchors.—Frederick Wittram, San Francisco, Cal. Patented June 9th, 1868:

1. I claim openings made lengthwise in the shank of an anchor, through which arms or flukes move freely to either side, substantially as herein described.

2. The placing of two or more jointed arms or flukes at different portions of the shanks length, at or about at right angles to each other.

This is a valuable invention, which has already been mentioned in the Press. It is now being patented in the leading European countries through the Mining and Scientific Press Patent Agency.

California Academy of Sciences.

A Regular Meeting of the Academy was held on Monday evening, October 5th, the President, Dr. James Blake in the chair, and fourteen members present.

Mr. W. H. Dall, who had just arrived from Alaska, being present, the regular proceedings of the Academy were postponed in order to listen to an account of his explorations in that country. Mr. Dall has resided there during the last two years, and has been engaged in studying the geography, geology, climatology, natural history and ethnology of the country; and he and his companion were the first white men that ever penetrated some of the interior regions. He has compiled a vocabulary of the language of the various tribes, by which he is enabled to deduce some interesting facts regarding their history. He has also visited Kamtschatka and the islands of the vicinity, and from the similarity in language and customs of the coast tribes of Alaska to those of Kamtschatka, he concludes that they are recent emigrants from Asia, and indeed, that are still coming over. They carry on quite an extensive commerce across Behring's Straits in skins, frames for boats, hunting and fishing equipments, etc. The Asiatic emigrants, however, are confined to a few leagues of country along the coast and large rivers, while a totally different people inhabit the interior. The boundary line between these two races is very marked, and encroachments on each other's territory are never tolerated. If a hunter passes the line in the chase and kills any game, he can take the carcass away, but must leave the skin at the nearest village. They are as strict as the Jews in preserving purity of blood, for they never intermarry. The interior Indians are the true aborigines of America, having the same characteristics as the Mound Builders farther south, and the race distinctions are identical throughout North America.

The Youkou Indians on the coast do not build ice houses, but Mr. Dall showed an intelligent Youkon Capt. Hall's picture of an igloo in the Greenland and Hudson Bay regions, and asked if he knew what it was. He replied that he did, and that the people up north built them and called them igloos. The name for ice house, (igloo) and the names of various animals are the same on the northern coast of British America. The tribes take their names from the river, valley or mountains which they inhabit, as the "Men of the Youkou," "Men of the Tanana," "Men of the Mountains," etc., and they each have local customs peculiar to themselves. In one tribe their dead, instead of being *laid out* for burial, are doubled up in the most compact form possible. Before they are cold, the knees are doubled upon the chest, the head bent back between the shoulders, the arms wound about in curious style, and thus left to stiffen. They are then placed in boxes painted with figures indicating their pursuits and condition in life, and buried with all their worldly goods. Two feet beneath the surface there is eternal ice, and the cold seems to embalm them, for if dug up a few months or years afterward, they will be found fully preserved but withered and dry like a mummy. Others again place the bodies erect on the surface, drive posts down around them, and bind all up tight with skins; and here they wither in their narrow house. Others, yet, tie them up like a "bucked" soldier and cast them out to the crows and foxes. If the flesh is all eaten from their bones before it commences to decay, then it is supposed that their souls are sure of bappines; but if neglected by the wild beasts it is an omnious sign. Their arms and property are placed near them, and the most skeptical never dare rob the dead, nor handle their property. The waters of the Tanana, a river of mountains, had never before been disturbed hy the paddles of a white man, and away in the interior was a small stream which the Indians would never approach on account of a superstition concerning it. If they should shoot arrows at a certain hill there, the arrows would disappear in the air and great evils would come upon them. Into this country Mr. Dall ventured, not having the fear of the Indian gods before his eyes, and found great numbers of fossils. So abundant were they that it seemed as if some commotion or convulsion had driven the animals there—the mastodon, elephant, deer, musk ox—and suddenly destroyed them. So many huge bones may have frightened the Indians and given rise to their superstitions.

The Aurora Borealis was often seen, and Mr. Dall says it appears as if caused by some substance borne along in the air which reflects the light. The Esquimaux will never look at it, for they believe it is supernatural, and fear it. They say also that it affects the eyes. After a careful study of the question of an open Polar Sea, Mr. Dall is firmly convinced that it does not exist. He believes that an unbroken sea of ice stretches over from America, past the North Pole, to Asia. Evidences in support of the open sea theory failed to present themselves to his observation. Ducks and geese are innumerable along the Alaskan Coast, but they are never seen flying northward of the main land. The Eider duck comes from the East Indies to breed. Butterflies are very plentiful, and many of the species found in the Atlantic States are common. Flowers are not abundant, and are quite scentless. This is the land of herries, for here in profusion grow the cranberry, raspberry, heathberry, salmouberry, currant, etc., and a species of wild cherry is found, but it is simply a seed without the pulp. It is usually supposed, and so represented on maps, that the Rocky Mountains extend to the Arctic Sea; but this is erroneous, for the mountains end at about the headwaters of Porcupine River, and a level plain or disconnected hills make up the remainder of the landscape northward. This summer has been the coldest known there for eighteen years. In the Youkon region, no traces of glaciers were discovered, and it is believed none ever existed north of the Alaska backbone. South of that, along the entire coast, the deep inlets and fiords, resembling the Norwegian fiords, are supposed to have been caused by glacial action, as there is always a glacier at the upper end of them.

[Other facts respecting the geology of the country which were presented by Mr. Dall have been given in separate articles in the last number of the Mining and Scientific Press.]

The next meeting of the Academy will take place on Monday, October 19th. Meantime, a steamboat excursion is to take place to some point, not designated, on the bay.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Shasta Hydraulic Mining Co.—Sbasta county. Oct. 7th. Capital stock, $100,000; 100 shares, $1,000 each. Trustees: Edward Gibbons, Rodman Gibbons and Jas. E. Freeman.

Homestead Association.—San Francisco. Oct. 7th. Capital stock, $51,000. Trustees: James Smith, H. C. Swain and W. Turnbull.

Concordia Gold and Silver Mining Co. El Dorado county. Oct. 8th. Capital stock, $320,000; 3,200 shares, $100 each. Trustees: F Stanle, A. J. Downer, S. C. Bradshaw, I. Moffit and Robert Kirk.

Election of Officers.—Bank of California.—Oct. 6th. Trustees: D. O. Mills, W. C. Ralston, W. E. Barron, N. Luning, Thos. Bell, D. J. Tallant, A. Hayward, Louis McLane, John O. Earl, L. Sachs and A. J. Pope.

Home Mutual Insurance Co.—Oct. 6th. Trustees: C. C. Perkins, C. S. Hobbs, A. S. Edwards, W. J. Lowry and J. W. Work; President, Geo. S. Mann; Secretary, W. H. Stevens.

Wm. J. Stoddart, the late superintendent and business manager of the Mechanics' Institute Fair, has been appointed Assistant Librarian of the Institute, and will hereafter be in attendance at the Library on Post street.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, October 10, 1868.

Financial.

We are indebted to the *Commercial Herald* of this city for the following interesting statistics, being part of an elaborate review of financial and commercial matters pertaining to this port, published in its columns on the 6th of October:

TREASURE PRODUCT, IMPORTS, ETC.

The receipts of Treasure from all sources, through regular public channels, during the past nine months, as compared with the same period in 1867, have been as follows:

	1867.	1868.
From California, Northern Mines	$18,673,774	$18,362,236
From California, Southern Mines	3,288,383	3,456,720
From Nevada	13,500,000	12,000,000
From Coastwise Ports, Oregon, etc	4,242,036	3,338,426
Imports, Foreign, British Columbia, etc	2,880,450	2,138,861
Totals	$42,584,593	$39,436,243

The decrease in the above treasure receipts from our mines and coastwise and foreign receipts, for the first nine months of 1868, is $3,088,350 less than for the same period of last year; but it must also be borne in mind that our shipments have been $3,000,000 less, showing that we are actual gainers to the amount of half a million. However, a very large percentage comes to this city in private hands, and does not enter into this account. Our receipts from Nevada show a decreased yield of about $1,500,000, owing to the fact that the Comstock lode has not been so prolific of bullion during the current year. Large amounts of bullion credited to Nevada are really received from Idaho and other outlying mineral regions.

MOVEMENT OF COIN IN THE INTERIOR.

The following has been the circulation of coin through Wells, Fargo & Co.'s Express for the past nine months, and Pacific Union Express Company for the past three months, combined:

	To Interior.	From Interior.
January	$916,058	$890,913
February	677,989	666,061
March	695,541	330,815
April	977,181	804,096
May	937,187	457,287
June	1,031,644	541,892
July	1,296,750	736,980
August	1,778,605	449,899
September	1,578,648	626,062
	$9,890,423	$5,114,155
Same time in 1867	7,807,476	3,704,964
Increase in 1868	$2,082,947	$1,409,191

Showing an excess of remittances to the interior, as against receipts first nine months of the present year, of $1,776,268; same time 1867, $4,102,512.

MINT STATISTICS.

The total coinage for the first nine months of this year compares with that for the like periods in 1866 and 1867 as follows:

	1866.	1867.	1868.
January	$ 315,000	$ 124,000	$ 97,000
February	819,500	1,022,000	646,000
March	1,309,000	978,535	575,000
April	1,113,000	1,835,000	710,000
May	2,165,000	2,505,000	714,000
June	1,120,000	1,420,000	922,000
July	1,004,000	1,152,000	2,355,000
August	1,747,000	2,380,000	1,465,000
September	1,916,000	1,889,000	2,155,000
Totals	$11,659,500	$13,465,535	$9,933,000

The decrease in coinage since last year is attributable to the diminished demand, rather than to any deficiency in bullion. The greater portion of our treasure shipments are now made in gold coin, instead of coin, a decided preference for this kind of treasure has lately been evinced by our Chinese merchants, for some reason best known to themselves. Their demand for Mexican dollars seems to have been partially displaced by their recent preference for gold bars and gold dust. The principal shipper of coin has been the Sub Treasury, who has sent to New York, since January 1st, 1868, the moderate little sum of $7,500,000; being $2,000,000 more than was shipped by that officer in all of 1867. It will be seen that more money was coined at the Branch Mint in September than in any other month of the current year by the sum of $100,000. It must also be borne in mind that our large grain bill is for last year and the year previous have taken the place of coin in the European and Atlantic American markets, cutting down the home demand, and circumscribing it to a great extent within the limits of our local requirements.

REAL ESTATE.

In our review of July 22d, the following paragraph appeared: "There is now scarcely a lingering doubt but that the Pacific Railroad will be completed by the middle of next year, and then the prices of real estate in this city will receive an impetus which may go beyond rational bounds. The change will be made so imperceptibly that we scarcely be doubted, and as the desire to possess this kind of property is indisputably the ruling passion with San Franciscans, they should exercise the greater caution during periods of unusual excitement." Since then prices have risen with wonderful rapidity, and the number of sales have proportionately increased, with a prospect of further rise. Business property is especially in demand. The sales for September exceed in value those for any other month of the current year, except March, when they amounted to only $20,548 more. The following table will give the transactions for each month at a glance:

Month.	Sales.	Amount.
January	433	$1,713,997
February	614	2,669,875
March	731	2,825,943
April	693	2,365,267
May	522	2,107,283
June	484	2,148,071
July	506	2,265,567
August	603	2,383,371
September	632	2,805,398
Total	5,218	$21,484,769
First nine months of 1867	4,236	13,072,050
Increase in 1868	982	$8,412,719

The subjoined table states the number and amounts of mortgages and releases in each month for the first nine months of 1868:

Month.	MORTGAGES.		RELEASES.	
	No.	Amount.	No.	Amount.
January	265	$814,288	163	$419,853
February	232	892,813	188	607,320
March	283	804,962	196	498,494
April	287	1,032,978	174	539,463
May	269	986,570	198	594,902
June	277	1,013,515	176	434,849
July	233	1,373,950	178	486,158
August	249	834,198	289	517,330
September	275	1,125,385	161	372,375
Totals	2,441	$8,987,888	1,723	$4,500,584
In 1867	1,884	7,272,409	1,182	3,986,935
Increase, 1868	457	$1,715,479	546	$501,649

An increase of 982 sales, with eight and a half millions, and of 457 mortgages valued at nearly two millions, with a corresponding increase of 546 releases to the extent of over half a million of dollars in the first nine months of this year over the same period of last year, furnishes one of the best evidences of our material progress and the growth of this city. The foregoing statistics have been gathered from time to time from Carter's *San Francisco Real Estate Circular*, which is undoubted authority in all matters pertaining to real estate.

City Stocks.

Few public sales of miscellaneous stocks were made during the past week. Gas stock sold at $77 50; Omnibus Railroad at $70; Spring Valley Water at $65 50. The latter company will disburse their usual monthly dividend on the 12th instant. The quarterly meeting of the Pacific Insurance Company was held on the 6th instant. The report to the Board showed a surplus of nearly $500,000 over their capital stock. It required $262,872 to reinsure outstanding risks, leaving a net surplus of $221,924. They pay a dividend of one per cent. per month, or $3 per share, for the quarter ending September 30th. The Union, Merchants' Mutual Marine, and Occidental Insurance Companies declared dividends of one per cent. per month for the quarter just closed. At the annual meeting of the Home Mutual Insurance Co., George S. Mann was re-elected President, and W. H. Stevens was re-elected Secretary. At the close North Beach and Mission R. R sold at $70.

The stockholders of the Bank of California, at their annual meeting on the 6th instant, re-elected the old Board of Trustees, as follows: D. O. Mills, W. C. Ralston, W. E. Barron, Nicolas Luning, D. J. Tallant, Alvinza Hayward, Louis McLane, John O. Earl, L. Sachs, and A. J. Pope.

Mining Share Market.

The mining share market has been characterized by a fair degree of activity, and nearly all stocks were well maintained. The sales of several stocks were quite large, at a very considerable advance, and as a general thing the market seems to have acquired more tone. Several new descriptions of stock have made their appearance on the market, and the transactions during the past week embrace a larger number of stocks than for some time past. Both the Savage and Yellow Jacket claims have improved in their yield of ore, and as we before remarked, our faith in still more extensive discoveries in the lower levels of the various claims remains unchanged; however, so far as regards the above mentioned claims, we think the recent sharp rise is principally attributable to "cornering" operations.

IMPERIAL—sold within a range of $109@116, then at $113, and closed at $112. The receipts of bullion in September amounted to $64,531 53, against $55,627 68 in August. On the 7th instant the shaft was 98 feet in depth below the 900 level, with no change in rock. The face of the main drift is now in quartz and porphyry, and it is proposed to run this drift until they lose the quartz or find the west country rock. They are again extracting ore from the 600 level of the Alta mine, and from the 400, 230 and 150 levels they are extracting the usual amount of ore, together making about 150 tons per day.

CROWN POINT—has been less active than last week, selling at $50 50@43, and then at $45 50, and closed at $44. The expenses for the month of September were about $57,000, and the receipts $50,675. Work is carried forward with vigor on the 900 level, without any favorable developments; otherwise, no change in the mine.

HALE & NORCROSS—sold at $49@51, and closed at $48 50. On the 30th ult., the shaft had been timbered 84 feet below the third station. Work has been suspended for a few days, in order to repair machinery. The fourth station of this mine will be 130 feet below the third, making a total depth of 930 feet, and will correspond with the seventh level of the Savage mine, at a depth of 952 feet.

KENTUCK—declined from $293 to $265, and closed at $272. The receipts, so far, for September account aggregate $116,866. A dividend of $20 per share is payable on and after to day.....CONFIDENCE was in the market at $27 50@25. The bullion returns for September foot up $21,280, being the product of 1,152 tons of ore, equal to $18 47 per ton.....GOLD HILL QUARTZ sold at $50. Bullion yield for September, $10,318—product of 504 tons of ore, equal to $20 47 per ton.....EMPIRE sold during the week at $105@100. The bullion returns for the month of September aggregate $18,836 82.

GOULD & CURRY—declined from $106 to $100, and at the close realized $104. During the week ending on the 4th inst., the Bonner shaft had been sunk 9½ feet, the material extracted being principally tough, black clay. Considerable ore has lately been taken from the tunnel croppings.....OPHIR declined from $22 to $18 50, and at close $19 is bid. The new shaft is 472 feet in depth, and they are now down on a level with the bottom of the old mine. The water is at present decreasing, and the rock is easier to extract.

CHOLLAR-POTOSI—opened at $160@162, declined to $153, then sold at $152 50, and closed at $152. During the week ending October 2d, they extracted 1,020 tons of ore. The stopes are said to look as promising as they did a week ago. The north drift is 364 feet from the incline, and the incline is 98 feet below the 1,100 station. The receipts for September foot up $78,013.....OVERMAN rose from $85 50 to $100, declined to $35, and closed at $87. The receipts, so far, for September account aggregate $31,000. The drift east on the 361 level shows good ore, and the one south on the 400 level progresses steadily. On the 500 level raise, the western cross-cut looks more encouraging than the eastern one.

ALPHA—advanced from $51 to $56, and closed at $54. The 940 station is reported to look well, and will soon be opened more extensively. The 250 level does not look well.....SAVAGE declined from $121 to $110 50, then sold at $120, and closed at $114 50. For reasons before stated, we are minus a detailed statement as regards the present condition of this mine. A dividend of $5 per share is payable on and after to-day.....SEGREGATED BELCHER sold at $11 25@9 50 per share. At the annual meeting of this company, the following gentlemen were elected Trustees: A. K. P. Harmon, John Sime, J. E. de la Montagnie, O. Dickinson, Jr., and Geo. Congdon.....YELLOW JACKET jumped from $1,400 to $1,600, declined to $1,480, rose to $1,645, and closed at $1,560. The prospects are reported to be very fair below the 800 level.

INSTRUCTION AT THE MECHANICS' INSTITUTE.—Classes are being formed at the Mechanics' Institute for instruction in various useful branches, as may be suggested or demanded by numbers of persons desiring to avail themselves of the same. Mechanical and free hand drawing will be taught by one of the instructors of the Pacific Business College.

NOTICE.—Mr. George Benson or Frank F. Doland, of Sacramento, will please send their address to this office, so that their business with us can be properly and promptly attended to.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT.	DAY DELINQUENT.	DAY OF SALE.

NEWS FROM THE ARCTIC REGIONS.—Dr. Goold, recently arrived from the Baffins Bay country, reports additional discoveries by Hall's expedition, of facts and relics concerning the fate of Franklin; and says that last winter, which was so unusually severe in the lower latitudes, was the mildest ever kuown in the Arctic regions, the temperature at no time falling lower than 40 degrees below zero.

From the German North Polo expedition, the latest news is that on the 19th of July, the Germania had reached 80 deg. 30 min. north latitude, and that the expedition had proceeded with its exploration 100 miles northeast of Bear Island, where they arrived on July 5th; while the Swedish expedition reached there only on the 22d of the same month, and remained until the 27th. The Germania having taken in fresh water proceeded thence in a northerly direction. A Stockholm dispatch of September 5th, says: "News received from Spitzbergen, dated the 3d of August, states that the Swedish North Pole expedition had proceeded northwards beyond the 80th degree, and found the passage open and free from ice."

A PUBLIC TEST is promised soon of Mr. Potter's three-flanged cannon ball, whereby the rifling of the bore of firearms is claimed to be superseded.

NOTICE.—If Mr. Thos. Mann, who applied for a patent on a "Brick Hoisting Machine," will call at this office, he will learn something to his advantage.

THE late showers and delightful sunshine of the last few days have given a freshness and beauty to the grass and shrubbery at Woodward's Gardens, that render the grounds just at this time exceeding y attractive. Concert to-morrow as usual. *

IF spectacles are used before they are required, or if their use is postponed when needed, the eye is injured. Consult C. Muller, Spectacle Emporium, 205 Montgomery street, before purchasing. *

STATE FAIR PREMIUM FOR CONCENTRATOR. J. Hendy, of this city, received the first premium at the late State Fair in Sacramento, for the best concentrator on exhibition.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Sept. 26th: The rock in the Mt. Bullion tunnel is said to be very hard, only nine feet having been made by six men last week.

The Imperial tunnel is progressing.

Mr. Davidson of the Silver Creek mill has been obliged to throw up the contract he had with I.X.L. Co. for 100 tons of first class ore at $100 per ton, because of the inability of the company to supply the ore except in quantity so small that it would not pay to start the mill on it. It is said they have considerable ore out, which it is thought will pay to work at the Pittsburg mill. It is said they have struck a pay streak this week of greater promise than any for sometime. The ledge seems to get better as they go up on it.

Active steps are being taken to have the ore from the Rippon ledge, just cut out, worked as soon as practicable. It is said that the ledge here laid bare is creating some speculation in the minds of stockholders in the Mountain Co.; some contending that it is the Mountain lode, while others say it cannot be, for, from its strike and course the Mountain tunnel would not reach it under 2,000 to 2,500 feet, whereas, 1,200 to 1,500 feet would suffice to cut the Mountain lode.

The Knox Co. commenced work on their claim last Monday, under the management of Wm. Kent. This claim belongs to a San Francisco Company.

Amador County.

Dispatch, Oct. 3d: Trowbridge & Co. have erected a whim at the shaft on their claim, which is on the north extension of the Coney lead, and are prosecuting the work with vigor. The shaft is down 125 feet, but as the lead has not yet been tapped at that depth, its width and richness is not known. It was tapped about 80 feet from the surface, where it was found to be 12 feet wide, with every prospect of increasing in width and richness as they go down.

Kern County.

Havilah *Courier*, Sept. 29th: Some time ago we published a notice of the discovery of the Esperanza mine, located about five miles to the southwest of the celebrated St. John mine, in the north end of Kelsoe Valley. The location embraces 1,000 feet, owned by Carter, Sterns, Birdseye, Low, and Moreno—and from Mr. Sanderson—just in from that locality, we learn the following concerning it: The ledge has been opened on the surface for a distance of 800 ft., disclosing a vein of the average width of 26 inches; and a tunnel run in on the ledge between 100 and 200 feet, from which they are now extracting ore at a depth of 150 feet from the surface. The width of the vein in the tunnel averages fully as large as on the surface, and of quality equally good. Forty-two tons of the rock, taken partly from the tunnel, and partly from the surface workings without selection, and specially with a view to test the value per ton of the whole ledge, was worked recently at the Gold Hill quartz mill, and yielded $800, or a fraction over $19 per ton. This in view of the facilities for working quartz in the immediate vicinity of the mine, is eminently satisfactory to the owners, and proves beyond a doubt that the Esperanza will be a permanent and paying mine. The rock in the ledge is soft and easily worked, and the gold free and readily extracted. They have now about 60 tons of ore on the dump, and with the facilities for deep tunneling they possess, can hereafter obtain any amount of rock they may desire. We learn it is in contemplation to erect a mill shortly on the ledge....Several other ledges have been discovered in the vicinity, some of which prospect extremely well....In Ticknor's Basin, Mount Sinai district, Monckton & Sprague are opening the Grant mine. They have two shafts down, respectively 100 and 70 feet deep. The ledge is between eight and nine feet wide, and good judges estimate that it will pay upwards of $15 per ton.

Mariposa County.

Mail, Oct. 2d: From all parts of the county comes cheering news of new developments in our mines. At the Ellis mine, on Sherlock's, worked by the Linn Bros., we hear that they have a tunnel in 600 feet, and the rock is increasing in richness; a large portion of it is rotten quartz and dirt, which is being piled up preparatory to being worked in sluices the coming winter. The hard rock will be worked with arastras. This mine has been a paying institution the last ten years, and bids fair to be more remunerative than ever. The Eureka mine, better known as the Snyder vein, is located on the divide east of Hite's Cove. Work has been resumed, and a shaft is down 75 feet. The vein at this depth is 3½ feet in width, and the ore increasing in richness. The Brooks vein, lying north of the Elkhorn, is turning out rich rock, and more hands have been added. The lumber for the mill on the Harbor vein, is all on the ground, and Wilcox is working night and day to get the machinery ready. A new mill is also going up near Bridgeport, on veins owned by J. H. Neal and others; Wilcox has also the contract for necessary machinery. And at Hite's Cove everything is in full blast, and a large number of men employed. Teams loaded with machinery for Nat Harbert's new mill, on the Fresno, passed through Mormon Bar Tuesday. Placer miners are getting in sluice lumber, and preparing for winter work, and should the season be favorable for dry diggings, we may anticipate larger returns from that source than have been obtained in the last three years.

Nevada County.

Transcript, Oct. 1st: The Erie Co. have located 1,000 feet on the first south extension of the Jim Crack ledge in Eureka township.

The Hixon & Bixby Co. have located 1,200 feet on a ledge 120 yards from the Norridgewock quartz mill, above Gold Flat. The ledge looks well.

The Grass Valley Consolidated Mining Co., an English incorporated company, has purchased of Wm. O'Connor Sidney, certain mining claims on Union Hill, Grass Valley, for £110,000. The sale includes the Bulger claims and Doran, Murphy & Co's claims on the McGrand ledge.

Oct. 3d: The Banner Mining Co. are going to add 10 more stamps to the mill, making 40 in all. A new and heavier engine is also to be put up.

Gazette, Sept. 29th: The quartz mill of Palmer & Everingham, near Graniteville, we are informed, will start up for regular work to-morrow. They have some 200 tons of rock at the mill ready for crushing.

Oct. 2d: The Banner mine is now yielding ore in such large quantities that notwithstanding the 30-stamp mill is kept running steadily, a vast amount has accumulated. The owners, therefore, have determined to add 10 more stamps to the mill, and also to put in a more powerful engine than that now used. The mill will then have 40 stamps, and be able to crush from 70 to 75 tons every 24 hours. The yield of the mine, during the year ending on the 1st of September last, was $235,000, and in that time the work was suspended nearly two months. The yield previous to the 1st of September, 1867, had been $176,000, making the total gold product of the mine, up to the 1st of last month, $406,000. The further the mine is explored the more favorable the prospects appear, and it is understood that the late developments of the size of the vein and quality of the ore, in the lower levels has been one of the inducements to the owners to enlarge their mill.

Grass Valley *National*, Sept. 30th: The Idaho mine, from 350 tons of rock, realized from their clean up of last Monday the sum of $14,400.

The Sebastopol mill, known as Ben. McAuley's mill, is running day and night, and is kept constantly employed. They were crushing rock to-day for La Marque, from New York Hill, which looks well and prospects excellently. A. B. Brady has some rock on hand from Chivanne's old mine which promises to yield well.

Oct. 1st: Seventeen loads of quartz from the Golden Gate ledge, situated about 1,000 feet east of the Eureka, were crushed recently at the Gold Hill mill and yielded at the rate of $22 per ton.

EXCELSIOR.—The Alpine *Miner* of Sept. 30th, says: A letter from the Secretary of the Enterprise Co., Excelsior, dated Sept. 9th, says: We are surprised this morning with the receipt of $1,648 of $20 gold bullion, from the 20 tons run through the Hagan superheated steam furnace. The same amount and apparently same quality of ore, previously run through by the best mill treatment we could give it in a raw state, only yielded about five ozs., at a loss of about 460 lbs. of quicksilver. The company has better ore than that just treated.

Transcript, Oct. 6th: The new 10-stamp mill of the Mohawk and Montreal Mining Co., Meadow Lake, started up for steady work on the 1st of October, and is crushing ore from the mine. The battery and plates look first rate, the amalgam being collected in heads upon them. The ledge in the lowest level is 4½ ft. wide and the ore of first rate quality.

Plumas County.

Quincy *Union*, Sept. 26th: The Penn. mill at Indian Valley, is not running at present. The owners have sold the engine to Judkins & Kellogg, of Cherokee, who will remove it to their ledge, to be used to run their hoisting machinery.

Several companies are at work mining on Spring Garden Creek, and are averaging good wages.

The Eureka Co. are now taking out some of the richest rock ever found in that section of the county. It is taken from the new ledge recently discovered by the caving in of the old mine.

The correspondent at East Branch writes: The Halstead Co. continue piping, and from the prospect they are getting, they will make the best clean up they have made for years.

Sheiser & Co. are cleaning up, and judging from the gold already taken out, they will make good wages for all work done.

Cole, Wright & Co. have discovered a rich deposit in the hill directly opposite Twelve-Mile Bar, and are making $5 per day to the hand, though working under disadvantages.

The Mathew Bros. are running a tunnel at the lower part of Twelve-Mile Bar, with a view to strike this new discovered channel. Other claims have been taken up, upon which work will be commenced immediately to find the same lead.

Mr. Ward has about completed his flume and will have everything connected with it running nicely this week. This is one of the most extensive operations of the kind ever undertaken in this vicinity. Judging from the prospects already got, and the huge gold found in close proximity, there is no doubt but it will pay immensely for working.

McBeth & McNealy, at the old Ball claim, are making ⅓ ounce per day to the man, though they have but little water.

Capt. Courser is preparing to work new ground. From the way it prospects he has a good thing.

Thompson, Mercer & Co. have suspended work on their river claim until next spring, in consequence of high water.

San Bernardino County.

Guardian, Sept; 26th: A rich ledge was struck recently about half-way between Graniteville and South Fork. It is large, well defined, and miners think the rock will yield from $35 to $40 per ton.

Sierra County.

Downieville *Messenger*, Oct. 3d: The Wolf Creek quartz mill was set in motion on the 15th ult., and has been pounding away at rich rock since. We have heard several speak of this mill, and they all say it is one of the finest little mills in the county, and runs like a top. The mine is believed to be an excellent one, although it is situated in the bottom of Wolf Creek and all the ore has to be raised through a shaft, the owner feels sanguine of having a good thing.

The Port Wine correspondent writes that the Monte Cristo Slope mine has been paying $10 per day for some time. The Indian Queen and Old Eagle claims are now paying wages. The Erie Co. have suspended work on account of a dispute among the shareholders.

Nevada *Transcript*, Oct. 2d: A correspondent writing from Tippecanoe, Sierra County, says that the mining prospects in that locality are excellent. In the claims of J Rowland and B. Henry, they have sufficient water to last nine months of the year. They are making preparations for extensive work this winter, and will work out a large extent of ground.

Siskiyou County.

Yreka *Union*, Oct. 3d: Rohl. Whittle informs us that a company of Oregonians, who had been out in the Goose Lake locating ranches, picked up on their return on the headwaters of Martin's river pieces of quartz containing gold.

The miners on the Klamath below Cottonwood are beginning to get into their claims. Shaft, Smith & Co. have got down and for three days work last week took out 28 ozs. The prospect in their claim for a large yield is excellent. The Ellis's, who sunk down right at the upper edge of Groat's ranch, have struck good pay and are taking out an ounce a day to the hand. There are several other claims in which they will get down shortly when it is believed they will receive large pay.

COLORADO.

Georgetown *Miner*, Sept. 17th: Gov. A. C. Patterson is developing a lode on the west face of Leavenworth Mountain, called the Conqueror, that is producing a high grade of sulphuret ore....Huepeden, Wolters & Co. have shipped since our last issue, 1,429.25 ounces of silver bullion, coin value, $1,609.03....Mr. Herriek is taking down the old smelting furnace at the Georgetown works, which had become thoroughly unfit for use. The hearth, some 36 inches in thickness, has lost its entire original character as brick, and is a mass of silver, lead riches, and sulphide and oxide of lead. Tests made from different portions and different characters of its material, gives from $500 to $1,000 in silver to the ton....W. H. Linn has made a new discovery on Democrat Mountain, which he has named the Amazoo. He is driving an adit on the vein, and has about 20 inches of gangue interspersed with zinc-blende, argentiferous galena, and sulphurets of silver....Prof. Fred. Schirmer has leased the Georgetown Smelting Works, and associated with him in their management, Prof. Wm. Bruckner. They are now erecting a reverheratory furnace, of an entirely different character from anything in the Territory. It has been worked with great success by Prof. Bruckner, in South America, on argentiferous galena and zinc-blende ores....Munson, Mason & Ball are working the Tenth Legion Lode, west of the Knickerbocker Co's property and adjoining it. Their shaft is 35 feet in depth, carrying three feet of pay quartz and 11 inches of solid iron sulphurets. The ore is being worked in the Knickerbocker stamp mill, paying $100 in gold to the cord. The ore is iron sulphurets, giving an average assay of $86 in gold to the ton.

Denver *News*, Sept. 23d: Williams, Cassiday & Kane are smelting the Henry Ward Beecher galena ore in the Scotch hearth, formerly used by Dr. Stowell. A lot of second-class Equator ore is being shipped to the California works below Black Hawk, for reduction. John T. Herriek shipped on Tuesday last 136 pounds of silver bullion, value $2,041.20. The dressing works at the Terrible lode are now finished, and in successful operation.

A letter from Summit County gives the following: In Gold Run there are four companies at work. L. Peabody is taking out an average of $7.50 per day to the man. Moffat & Co. have one hydraulic, and a flume 700 ft. long. The mine was worked for 12 weeks. The total amount taken out was $3,310.92—an average of $275.91 per week, or $13.13 per day to the man. Shock & Bro. are working six men, and taking out from $15 to $20 per day to the man. The Walker claim is paying $8 per day to the man. On Buffalo Flats, Geo. W. Mumford employs 8 men, who are taking out from $10 to $11 per day each. John Nolan is working 4 men, and his claim is paying $8 per day to the man. In Delaware Gulch, Geo. Mann is working 3 men, and is taking out about $12 per day to the man. Mr. D. R. Stogsdill is working 3 men, and is taking out $8 per day to the man.

IDAHO.

Owyhee *Avalanche*, Sept. 26th: Day before yesterday Cope & Co. struck fabulously rich gold-bearing quartz in the Potosi. The lode was found cropping out on the surface 300 or 400 feet south of the tunnel. Large crowds flocked to see the new discovery. All who have seen it unhesitatingly declare that it is the richest deposit of gold ore ever found in this or any other mining camp. We saw a piece weighing about 50 pounds, which, after being broken into fragments, was held together by threads of solid gold that penetrate the mass in every direction.

On Thursday last another quartz lode was discovered on the mountain west of the Baxter and between the Silver Cord and Savage. It is called the Appuremack, and prospects rich in gold and silver.

The frame of the Rising Star mill, at Flint, is up and nearly enclosed. The ore in the Rising Star gets richer the deeper the mine is prospected. A deposit of remarkably rich ore was struck this week.

Mr. Perry is still at work sinking on the Forest. The shaft is now down 140 feet, where the lode is about 12 feet between the casings. There is a granite horse in the center and rich pay quartz on each side. The granite becomes less and the pay streaks wider the deeper it is worked.

Lewiston *Journal*, Sept. 12th: We are informed that the Hawk Eye lode now being worked at Warren's Camp, is paying $100 to the ton.

Gold has been found on Clearwater River in paying quantities. Miners have already commenced work with rockers, and are making from $4 to $5 per day. The distance from Lewiston to the mines is but seven miles.

A very rich gulch has been struck at Elk City by some new comers; the gulch prospects from 10 to 50 cents to the pan.

The Pierce City correspondent writes thus concerning the new mines recently found in the Bald Mountain district: Out of 500 buckets (or pans) of dirt we got $27.25. The ground is nearly all taken up. It will take $3,000 or $4,000 to bring water into the gulch. The creek or gulch is called Gold Creek.

The Portland *Oregonian*, of Sept. 26th,

learns the following from Yuba district: The mill of the Greenhack Co. is engaged in crushing ore from the Atlantic ledge, which is yielding considerable bullion. The English Co. has fine mills, which they propose to set up on some rich ledge, and they are now making a critical examination of the Lucy Phillips, which will be purchased by them if results are satisfactory. The Monauk Co. have purchased, recently, 1,000 feet of the Atlanta lode, and are engaged in erecting a mill and taking out ore. They paid $225,000 for 1,000 feet of the richest portion of the Atlanta. The Minerva ledge has a reputation for richness—has no superior in the Yuba district. A tunnel has been driven into the mountain, which strikes the lead at a point 150 feet below the surface, where the ore is immensely rich, containing both gold and silver, with but very little baser metal.

MONTANA.

Helena *Post*, Sept. 25th: S. F. Molitor & Co., yesterday, cast the smallest "brick" on record in the Territory. It weighed half an ounce.

The Graadville 10-stamp mill, at Georgetown, Deer Lodge County, is nearly completed, and will commence running next week on rock from the Minnesota ledge. This ledge has been developed by three shafts, 30, 40 and 80 ft. in depth respectively, and by cuts run across the ledge. The width of the lode varies from 22 to 27 ft., and there already seems to be quartz enough in sight to run upon a year without stopping. The great value of the rock does not consist in any extreme richness, but in the very even manner in which the gold is distributed. It is expected that the ore will yield $15 to the ton for the full width of the ledge.

A correspondent at Nelson's Gulch writes: The Nelson mines are far from worked out. The bed-rock flume in the lower portion of the gulch, owned by Messrs. Pierce & Spiers, is yielding well. Taylor & Co's claim, just above, is paying half an ounce per day to the man. A few claims further up the ground of Norton & Co. are yielding from $7 to $9 per day to the hand. Still further up the gulch, Mr. John Miry is taking out from $5 to $9 per day to the man. A few claims above this last, Messrs. Hardibrook & Co. are constructing a drain ditch, by means of which they expect to be able to work some very rich ground. Next above the drain ditch is the bed-rock flume of the Swedish Co., by means of which is worked some of the richest ground in the Territory. As high as $12 to the pan of dirt has been obtained, and from $3 to $5 prospects are frequently secured. On Thursday last $10 in gold was obtained from one shovelfull of dirt. Although a scarcity of water prevents this company from washing the dirt from more than one set of timbers per day, it is still enabled to clean up from $90 to $135 daily, or an average of about $25 per day to the hand. The quality of the gold obtained is not excelled for fineness by any in the Territory. A short distance above this flume, and opposite discovery claim, a tunnel is being run into a bar which is expected to afford facilities for working some of the richest ground in Montana. The earth excavated in the prosecution of the work pays wages, or $4.50 per day. Above this point nearly every claim is worked with good results.

The Deer Lodge *Independent* says: The Clearwater mines pay only $3 per day to the man, and most of the stampeders have gone to Oregon. . .Wallace's Bar, in Deer Lodge County, has a pay streak 300 feet in width, and has been thoroughly prospected for 2,000 feet in length. One company has averaged $21 per day to the man, another company $15 per day to the man since the time the bar was discovered. It is thought that other claims will pay $50 per day to the hand....A prospecting party of 20 persons was to leave Missouri a week ago for the head of Milk River....During the past season, most of the claims at Rocker City have paid from $8 to $16 per day to the hand....The quartz of the Rumley & Bugher silver lode yields $50 per ton. The St. Louis and Montana Co. have leased this lode until May, 1869, and will pay the owners half the net product of the ore in payment for the use of the mine....The Hanauer mill has taken a large contract to crush quartz from the North Atlantic lode at $11 per ton....The quartz taken from the discovery claim of the Only Chance lode, at Highland, yielded an average of $150 per ton in an arastra since work was commenced upon it. It is to have a mill erected in the spring.

A correspondent writing from French Gulch says: Gold Hill is paying from $15 to $75 per day to the hand. Shenauigan Gulch is paying from $15 to $18 per day to the man. About 200 men are at work at the French Gulch diggings, and are making good wages.

The Virginia *Democrat* says: The bed-rock flume of Poole and Orr yielded 4,300 as the result of a two weeks' run recently.

NEVADA.

Winnemucca *Argent*, Oct. 1st: Mr. Kelly informs us that the new tunnel in the Golconda mine, now in 75 feet, south of the old shaft, has developed a four-foot vein rich in mineral.

Holt's mill is progressing, and will be finished sometime this fall.

The Union correspondent writes: Mining matters remain about as when I last wrote. The Pioneer Co. struck the Aga memnon ledge ten days ago. The vein is said to be a wide one and well charged with good mineral. Expect to go up to see it next week, and will then report. The Inskip boys report favorable developments. The Arizona wags along as usual. Plenty of good ore to keep both mills running day and night.

Reese River.

Austin *Reveille*, Sept. 26th: White Pine is rich, but Lander Hill appears occasionally with a rich streak. A ton of ore extracted from the Saratoga mine in Lander Hill, which has been just reduced at the Manhattaa mill, gave a pulp assay of $1,497.

During the week ending this date, there were produced at the Manhattan mill, 34,684 ounces of bullion.

Sept. 28th: The Centenary mill, in the district of Newark, is one of the productive works of this part of the State. Mr. Folsom shipped on Saturday last 26 bars of bullion, valued at $32,413; this swells the amount shipped by him to that firm during the present month to $84,409.90. The larger part of this bullion was produced from ore obtained from the Eberhart South in the district of White Pine; the remainder was produced by the Chihuahua mine of the Centenary Co. This mine presents an unusually fine appearance, and is supplying five stamps of the mill with ore.

The editor has seen some coarse powder resulting from two ounces of the ore produced by the Red Mountain mines, which was pulverized in a mortar. There was perhaps half a teaspoonful, one-third of which was fine gold. The estimated yield of this quality of ore in the mill is $250 to $300 per ton. Choice specimens of ore showed little bunches of free gold, and in some instances quite large pieces of gold.

The South American mine in Lander Hill, is one of the valuable mines of the district. Fifty-seven tons of the first class ore, which were reduced at the Manhattan mill, yielded an average of $302 per ton.

Sept. 30th: We saw to-day at the assay office of Boalt & Stetefeldt, the pulp of 13 lots of ore, which presented the liveliest display of colors and tints. There were five shades of drab, two of reddish brown, besides various other tints.

Oct. 2d: The Manhattan Co. shipped during the month of September just passed, bullion to the amount of $130,776.91.

Mountain *Champion*, Sept. 26th: On the dividing line between the El Dorado South mine and the El Dorado North, a shaft is being sunk for the purpose of prospecting both claims. It is about 80 feet deep, and discloses a fine body of ore from the surface downward. The pay streak is from two to three feet wide, of rich chloride ore. Eighty feet south of the boundary line, Leon & Co. have sunk an incline to the depth of 130 feet, at which point the body of pay ore is six feet thick. Masses of fine ore have been extracted from this incline. About 110 feet south of this work the company has commenced an incline five ft. wide and six feet high, which is to be sunk to the depth of 500 feet, with levels cutting the ledge at intervals of 100 feet. During the past summer a considerable part of the ore taken out of Leon & Co's mine was brought to this city for reduction, but preparations are being made to work the ore in that district in the future. The next important mine on the great ledge is the El Dorado North, belonging to the Belmont Co. The Champion learned from the foreman of the mine that a great body of rich ore had just been struck in the general incline which is being sunk on the line of demarcation between the two mines. Full two feet of the ledge yields ore which is estimated to pay from $6,000 to $10,000 per ton. It is characterized as the richest body of ore yet discovered in the district. Col. Buel is working the Transylvania and Highbridge mines of the Belmont Co. with vigor. The developments in the former mine are of a solid character. At the slight depth of 105 feet the ledge is seven feet thick, and is producing ore of finer quality than has yet been extracted. The Highbridge, which first gave character to the district, is being worked through a vertical shaft 160 feet deep, and the indications are that it will shortly produce valuable ore. The 10-stamp mill of the company at Belmont, will be furnished with reverberatory furnaces, by which means the valuable ores of the district will yield a larger proportion of their silver.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Oct. 2d: We were shown a bar of gold from the mine of the Sierra Nevada Co., at the north end of the city. The bar contained $2,118.47 in gold, and $102.65 in silver—total, $2,321.12. It is the product of 280 tons of ore, worked by the process common in California for gold quartz; that is, no amalgamating pans are used. The lot of 280 tons was run through the batteries in seven days, being at the rate of 40 tons per day. The whole cost of working does not exceed $2 per ton, whereas the yield per ton is nearly $8, leaving a clear profit of $240 per day for the mill. The ore crushed is taken from a sort of basin upon the side of the hill. It is a deposit of broken quartz and dirt resting above the regular lead, and there is apparently an almost inexhaustible supply of the same in the hill, the deposit being some 60 feet in depth and of an unknown horizontal extent.

The total shipment of bullion, for the month of September, from the office of the Pacific Union Express Co., in this city, was 4,000 lbs., valued at $117,766.60.

Oct. 3d: The Bonner shaft (the main shaft) of the Gould & Curry mine, day before yesterday, cut through a tough black clay, supposed to be that belonging to the west wall of the lead. The depth of the shaft is now a little over 1,100 ft.

Wells, Fargo & Co. and Union Express Co. shipped from their offices in this city and Gold Hill during the past week, 9,513 lbs. of assayed bullion, valued at $252,979.10.

Oct. 4th: The wraze to connect the 700 and 900-ft. levels of the Imporial mine is almost completed. The picks of these working upward can be distinctly heard by those who are working downward. The company have eight months ore in sight—principally on the 400 and 700-ft. levels.

A new mining district, called Black Mountain, has been discovered about 110 miles southeast of this city, and about 40 miles southeast of Walker Lake. Abe Bateman and Geo. Lamoreaux, are the discoverers of the new mines. The leads of the new district are gold bearing, and those that have been located show much free gold. Under the name of the Black Mountain Mining Co., Bateman, Lamoreaux, Burghess and others, have located three very fine leads and have commenced their development. They have sunk a number of small shafts, run in open cuts, and pretty thoroughly examined their leads upon the surface. They rigged up a rude arastra and worked a ton of ore from their principal lead, obtaining a fine yield of gold, notwithstanding the slovenly mode of working. The gold bar which Mr. Bateman brought to this city day before yesterday, was melted into a bar and assayed, and proves to be worth $45 per ton—nearly all gold. Mr. Bateman is confident that the ore will pay $80 per ton if properly worked. In working the lot above mentioned, they lost three or four pounds of quicksilver, and must have lost at least half the gold contained in the ore, as none of the parties were arastra experts. On the sides of the mountain about the leads of the company are at least 3,000 tons of ore in the shape of float rock, all of which shows an abundance of free gold. Their principal lead crops out upon the surface for a distance of 3,000 feet. The country rock is slate and porphyritic granite.

NEW MEXICO.

Santa Fe *Gazette*, Sept. 12th: News received from the Moreno or Maxwell mines, is that the mines hold out well. But few are at work on account of the scarcity of water, but those who can and do work are doing well. At New Orleans Flat, last week's run was 104 ounces, the number of men employed being only four. Willow Creek is turning out well, as they have some little water left. Grouse, Humbug, Negro, and all the other gulches are now dry. The ditch is about two-thirds completed; all the most expensive and most difficult is over, and the ditch could be completed in 30 days if the proper hands could be obtained.

OREGON.

Portland *Oregonian*, Sept. 28th: Quite an interest is again manifested in the Okanagan mines. Several places have been prospected this summer, and the results are rather encouraging.

A quartz mill will soon be taken into the Bohemian mines. Two more ledges have been discovered which prospect well.

Dalles *Mountaineer*, Sept. 25th: A new mining camp has been found about 30 miles from Pierce City, in the Bald Mountain district, and about 20 miles from the old Bald Mountain diggings. The creek on which this new camp has been discovered is about 10 miles in length, and it is thought that paying claims can be found on the entire distance.

Ancient Mounds Discovered in Utah. The Salt Lake *Telegraph* of September 19th has the following:

Prof. Simonin, engineer of mines, Paris, who is on a tour to the Pacific Coast, informs us that he has made an important discovery between this city and the Lake, while visiting the latter place during the present week. From his correspondence to us, he says that he was accompanied yesterday by Colonel Head, Postmaster Street, D. Huntington, Indian Interpreter, and two workmen to a sand mound, about eight miles west of this place, where they discovered the following interesting relics of another time: About eighty arrowheads of flint, cornelian, obsidian, etc.; a great number of human bones burnt; considerable debris of earthen pottery, some with a few ornaments; a hard stone of quartz or granite, some complete and some broken, which evidently served to grind grain; a few shells with a hole, which served as a collar, earrings, etc.; some small earthen articles, with a hole in the center for collars, etc.; some bones of animals, whitened by long exposure to the air, as of oxen, and perhaps buffalo, horses, squirrels, rabbits, etc.; but we are not sure that they are of the same age as the remains above mentioned.

Mr. Simonin thus continues:

What is to be deduced from these facts? First, that the system of mounds discovered in the Mississippi Valley extends perhaps to the Pacific, and that those mounds belong, secondly, in all the cases to a primitive race of Americans, different from the actual Indians, who do not know how to make earthenware, grind wheat or corn, or do not grind it by the same means as the aborigines who constructed the mounds, and finally, do not burn their dead nor put them under such mounds.

Facts about Land.—This State contains 188,981 square miles, or an area of 120,947,840 acres. It is computed that of this amount 89,000,000 acres, including swamp and tule lands, can be devoted to profitable husbandry. Of the whole area there are now forty million acres fit for the plow. There are also 40,000,000 acres to be classed under the general term of mineral lands, a considerable part of which can also be made very productive agricultural land. Only thirty millions of acres have been surveyed, leaving ninety millions unsurveyed, and not fairly accessible to the settler. Large quantities of this land are held by grant-holders, whose claims have been confirmed but have not been surveyed. In some instances a grant for 9,000 or 10,000 acres has been made to cover nominally, 30,000 acres. Under the Acts of June 2d, 1862, and July 1st, 1864, lands claimed through foreign titles are to be surveyed at the cost of the claimants. All foreign grants are to be found in the most favored localities, such as valleys where there are streams of water, and are also bounded by natural objects. If there is five times the quantity of land actually mentioned in the grant, the grantee holds it until the survey has been made, and be has a direct interest in delaying the survey until the latest possible day. Hence, large bodies of Government land have never been sectionized, and are not open for entry, because there is an unsurveyed grant in the neighborhood. Of the whole amount of arable land, 14,000,000 acres are in the valleys of Sacramento and San Joaquin; and about 16,000,000 acres are in the Coast Range. Beside the quantity enumerated as fit for the plow, there is a large breadth upon mountain sides where the vine produces the most perfect fruit. Poor lands with a red dry soils are now known to be choice localities for the grape. Nearly 9,000,000 acres of public lands in this State have, at various times, been appropriated for educational purposes, public buildings and internal improvements.

Saving by Machinery.—The number of threshing machines in the United States is set down at 235,000, and it is estimated that they save five per cent. more of the grain than the flail. This would save to the country more than 90,000,000 bushels of grain, worth at least $30,000,000.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influences and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:
Saturday Morning, Oct. 10, 1868.

Notices to Correspondents.

EFFERVESCENT.—At common temperatures, say at from 50° to 60° Fab., pure water will absorb its own bulk of carbonic acid; but under bigh pressure and cold, it may be made to absorb a much greater quantity, ordinary soda water being usually made to absorb from ten to twelve times its volume of this gas. The absorbability of the chief gases by water, has a very wide range, as will be seen from the following table of this property, as respects the principal gases:

50,000 parts hydrochl. acid is abs'd by	100 parts	water.
48,000 parts ammoniacal gas	"	"
5,000 parts sulphuric acid	"	"
200 parts chlorine gas	"	"
100 parts carbonic acid	"	"
6.6 parts carbonic oxide	"	"
5.0 parts binoxide of nitrogen	"	"
4.6 parts oxygen	"	"
2.5 parts nitrogen	"	"

all which gases, with the exception of hydrochloric acid, can be expelled by long continued boiling.

SCANDINAVIAN. Alpine County.—Bergman, as well as Linnæus and Berzelius, was a Swede. To Bergman moderns are greatly indebted for the extension of those branches of chemistry which depend upon the employment of tests. For, although this method was first pointed out by Sir Robert Boyle, its extension and accurate use did not come into the employment of chemists generally, until the appearance of the Chemists' "Essay on Mineral Waters." Bergman was born in 1735, and died in 1784, his death having been hastened by too intense study. His researches constitute efforts of no common sagacity, when we consider the state of chemistry of his time.

SALINAS, State of Nevada.—The average annual consumption of common salt in England, for the purpose of being decomposed by means of sulpburic acid, exceeds 400,000 tons of 2,240 lbs each. The "salt cake" so formed is chiefly used in the manufacture of soda; but also as "salt cake" or crude sulphate of soda in the manufacture of the inferior varieties of glass.

LUCIFER.—Phospborus is generally obtained by digesting for some time in a leaden vessel, 100 parts of bone ash with 90 parts of oil of vitriol and 950 parts of water, filtering the solution, and evaporating it to the consistency of syrup, afterwards mixing the same with 20 parts of charcoal powder, drying, and eventually retortiug in an iron retort.

L. M.—The best method of preparing a large quantity of bicarbonate of soda, is to pass a stream of carbonic acid gas over an atomic mixture of crystals of soda (sal soda) and the dry carbonate. Great beat is evolved during the process, owing to the rapidity with which the gas is absorbed.

PYROS.—The most intractable earthy base hitherto discovered, when subjected to intense heat accompanied by an oxygenated atmosphere, is the oxide of zircon. It gives enormous luminosity to the blowpipe flame, when exposed to it.

S. P. J.—Is received and will be attended to next week.

The Geology and Ethnology of the Youkon Territory.

A VAST AREA OF AZOIC ROCKS.

With the exception of the coast south of the great snowy range, and a basin of which the Koyoukuk Mountain (17) may be called the center, the entire Territory of Alaska is Azoic; the rocks exhibiting no signs of life whatever,—no fossils,—being chiefly crystalline schists containing a great deal of quartz. Granite is a very rare rock. It was observed only in one place, at the mouth of the Tanana, and there it contained mica, which was the only mica found in the country.

The snowy mountains near the Arctic ocean are probably azoic, as the streams coming down from that direction into the Youkon were well searched for pebbles, and nothing but the crystalline azoic rocks could be discovered.

EXPLANATION OF DIAGRAM.—a, Kwichpak River. b, Norton Sound. 1, St. Michael's Island. 2, Grantley Harbor. 3, Plover Bay. 4, Behring Straits. 5, Kotelkargut River. 6, Nulato. 7, Nuklukahyet and junction of the Tanana River. 8, Fort Youkon. 9, Russia Mission. 10, Andreoffsky. 11, Colville River. 12, Sbakeluk Slough. 13, Kolmakoffsky Redoubt on the Kuskoquin River, and portage to the Mission. 14, Cape Romanzoff. 15, Mt. St. Elias. 16, Nushergak Lake and Chulitna River. 17, Koyonkuk Mountain. 18, Kusilivak Mountain. 19, Country of the Mablemuts. 20, Cook's Inlet. 21, Kodiak Island. S, Ounga Island. 22, Point Hope. 24, Carboniferous Formation. 25, Volcanic. 26? Supposed Tertiary. 27, Azoic Rocks.

VOLCANIC ROCKS

take a pretty important position in the geology of Alaska, the great snowy ridge being itself a volcanic outburst, and having numerous craters and volcanoes that are active and constantly smoking. The line of volcanic action extends out into the Pacific, forming the middle or backbone of the peninsula of Alaska, and the Aleutian chain of islands; being a link in the great circle of volcanic activity which Humboldt traced around the entire confines of the Pacific ocean. Most of the northerly islands, or at least their foundations, are composed of true volcanic lava, as is also the coast between the Youkon and along Norton Sound. In many places it assumes a rude columnar form, resembling the rocks of the Giant's Causeway in Ireland, as at the beach near Fort St. Michael. (1.) The islands of St. Pauls and St. Georges in Behrings sea are composed of amygdaloid lava which separated into six-sided columns of a basaltic character, but having the appearance of being very much cooked. They have frequent earthquakes in that country. Though nothing has been reported quite so terrible as the memorable convulsions of St. Thomas, the waters in the southern harbor of Ounga Island (21) became excited in the midst of an earthquake on the 15th of May last, and suddenly diminished from a depth of 24 feet to four feet, in part of the harbor; the bottom remaining at the latter position permanently. Perhaps, owing to similar causes, the Isanotsky pass in the Aleutian Islands which was heretofore marked in the charts as navigable, is now impassable, the schooner Francis L. Steele having been nearly wrecked on the sand bars in attempting the passage on her voyage up to Behrings Straits. Volcanic country is represented in the diagram by lines slanting northeast and southwest.

CARBONIFEROUS FORMATION.

After leaving the lava country near the mouth of the Youkou, the traveler, on going to the northward, soon enters a large basin, showing blue sandstone strata, probably belonging to the lower carboniferous era. The rocks contain fine vegetable fossils apparently related most nearly to that era. Above the carboniferous sandstone, and overlying it, there is a formation, the original strata of which have been denuded and replaced by some tertiary strata containing lignite or fossilized wood, but not in quantities to be of any economical value. The rocks that were denuded belonged probably to the upper carboniferous series, as, in going up the Youkon there is a point found just below the Koyoukuk Mountain where they are observed in position and where they contain true bituminous coal. A small vein of it crops out near Nulato, the greater part of which, however, has likewise been denuded. At Clantilinteu, 150 miles below Nulato, in the Youkon, there is another small seam of coal, discernible in the blue sandstone. The upper and lower carboniferous formations are represented by lines slanting from northwest to southeast in the diagram.

TERTIARY FORMATION.

South of the Alaska volcanic ridge of mountains, extending eastward so far as known from observations, to Cook's inlet, and westward so far as to include part of the coast and Kodiak, Ounga, Ounalaska, and possibly other islands of the Aleutian group, there are fossiliferous strata containing lignite, the geological age of which is not yet determined with certainty,—but it is probably Eocene Tertiary. At all of the places named, coal has been reported. There has been some "blowing" about valuable deposits, which is scarcely warranted by the true facts. At Coal Harbor, Ounga Island, which was surveyed by Mr. Dall, the coal was carefully examined, and additional information was acquired from the Russians, all of which tended to prove the known deposits as but poor in quality, and deficient in quantity. The formation supposed to be Tertiary, is represented on the diagram by horizontal lines.

THE POST-PLIOCENE AGE.

All over the Azoic country to the north of the peninsula of Alaska, and the principal ridge of mountains, there are scattered post-Pliocene fossils. In swamps and bogs, and alluvial deposits, there are frequent relics of the mastodon, the extinct hairy elephant, the musk ox, etc.; and in some places there are strata of post-Pliocene marl containing fossil fresh water shells, as at Fort Youkon particularly. (8) Those animals continued to exist down to the end of post-Pliocene times, since which the contour and level of the country have not materially changed.

GOLD AND OTHER MINERALS.

Gold bas been found at the mouth of the Porcupine or Rat River, the branch which comes in from the north at Fort Youkon. It is fine scaly gold, like iron filings, but there is scarcely a color to the pan. The country is accessible only for three months in the year, during which time, however, the mosquitoes will extend a demonstrative welcome to sweet-blooded adventurers. Stains of copper were observed in the rocks near Cape Prince of Wales, on Behrings Straits. Micaceous iron ore, magnetic oxide of iron, and hematite, are found all over the country, and are made use of by the Indians for paints. Obsidian pumice stone, and a mineral which might be lazulith, are also found. On St. Georges Sound, Behrings Sea, the ruby or light red spinel, has been found nicely crystallized in a form similar to the diamond, which it approaches in hardness.

ETHNOLOGICAL.

The coast tribes of Indians on all of the coasts from Sitka to Makenzie River, come under the general name of Esquimaux, though they are not by any means like the Esquimaux Indians of the eastern side of the continent and the shores of Hudson Bay. They are tall, fine, athletic people, very intelligent, and superior to the genuine American Indians of the interior. They are ingenious in the use of the knife, and in making things. Any northwestern Esquimaux will draw from recollection a good map of the country that he may have traveled over. Though they belong to the same general race as the little eastern Esquimaux, having words that are the same, they are evidently later comers. The language and people of the Esquimaux Indians are almost exactly the same on the American side of Behrings Straits as they are on the Asiatic side. When they meet they can converse and understand each other perfectly. In Asia they go under the name of Tschuktchis. On the American side they are known under different names; at Grantley Harbor (2) as Kaviaks; towards the interior, at 19, as Mahlemuts; around the mouth of the Youkon and Norton Sound (*b*) as Unaleets; further to the south, as Aleuts, with jaw-breaking subdivisions.

The Kaviaks and Mahlemuts go up annually to the north coast as far as Point Hope, (23) and Point Barrow (150) and beyond, fishing, etc. They are fond of traveling, and seem to go with the intention of having a fine time, just as the New Yorkers go to Saratoga or the White Mountains. They cannot go through the country, on account of the interior Indians, and therefore go around.

The Indians of the interior of Alaska are the true race of native American Indians. They call themselves the Youkonikatana or "men of the Youkon," and have the same general appearance and characteristics as other American Indians. They are fine looking, and many of them tall; have aquiline noses, whereas the coast Indians have flat noses. They are wilder and more warlike than the coast Indians; they wear great bushy heads of hair (inhabited and unattractive) while the coast Indians have a fashion of cutting off a portion of the top bair, so as to resemble the monastic tonsure. They cannot understand each other; and as the interior Indians seem to own the most difficult language, the result is that they frequently acquire the coast dia-

lect to some extent, or a kind of trading jargon which serves for international communications. They are not friendly to each other, but do not fight much. They are all dying out, of asthma and lung complaints, caused by a "forty rod" tobacco which they get from the Russians, and the fumes of which are drawn incessantly into the lungs. It does not appear that the interior or true American Indians have any relationship whatever to tribes in Asia.

The coast and interior Indians build houses alike, the latter having borrowed their ideas from the coast, if they have any houses at all. Winter houses are half underground, and covered with earth, having a hole in the roof. Fire is made about twice a day. They get into their houses by an underground passage ten or fifteen feet long, on their hands and knees, the exit being vertical like a ground-hog's hole, and framed over, to keep out the snow. Communistic principles are in vogue as to dwellings, and general property. Both the coast and interior Indians are honest, and do not steal nor murder, except where they have been supplied with whisky by the traders.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

Mr. P. A. Haven, of Gold Lake, Sierra County, has sent us specimens Nos. 250 to 270 inclusive.

No. 250—Opal jasper; silica, containing a large amount of water, and several per cent. of iron; hardness between that of apatite and feldspar; being float or surface pieces from the gravel mines, and found in the vicinity of mineral charcoal.

No. 251—The same, found near the surface, granulated, and with less iron, which is partly in the form of greenish protoxide, and partly of the yellowish tinge which iron assumes in the cold borax glass.

No. 252—Opal, white and yellow varieties, the latter having the peculiar translucency of chalcedony and the resinous glance of the pitchstone. On one surface there is a white, soft mineral resembling chalk, but containing a great deal of alumina, cleaving strongly to the tongue, and when touched to water drawing it in eagerly with a rushing noise, without becoming plastic.

No. 253—Variety approaching to wood opal, which would commonly be called a petrifaction, as it shows a grained structure.

All of the above specimens are silicious concretions, like those so common in the chalks of England; occurring, as Mr. Haven says, in nests like hills of potatoes, but cracking and becoming coarse granular when exposed to the air. The country is described as a "burnt-lime, reddish sandy soil," and appears devoid of carbonates.

No. 254—Casing of the concretions; hardness like the preceding; in composition probably about the same as skapolith; in appearance resembling porcellanite.

No. 255—Genuine jasper, with beautiful bluish manganese dendrites.

No. 256—Chalcedony.

No. 257—Trachite.

No. 258—Hornblendic porphyry, with epidotic ground mass.

No. 259—Lime garnet, or grossular, characteristically crystallized.

No. 260—Iron garnet, or almandine, known in jewelry as the carbuncle. Probably some of these would be paid for by the jewelers, as they possess the deep translucent red characteristics of the precious garnet.

No. 261——Gold quartz from Gold Lake.

No. 262—Pebble of hematite.

No. 263—Vein piece of hematite, with jasper.

No. 264—Spinel, or ruby. A very small specimen, found in washing for gold. Of the size of a pea would be valuable.

No. 265—Hornblende rock, with coating of lime, probably from decomposition.

No. 266—Hydrated oxide of iron.

No. 267—Silica, crystalline, apparently from a stratified deposit.

No. 268—The same, covered with a peculiar moss.

No. 269—Epidote.

No. 270—Greenstone porphyry, with large crystals of orthoclase feldspar.

Proposed New Metallurgical Uses of Zinc and Lead.

Of nothing are our millmen more thoroughly convinced in these times than that quicksilver will not accomplish everything for them. Circumstances, and combinations of ores containing different ingredients, occur daily where the mercury refuses to go after the precious metal; there is an aversion, instead of an affinity. Millmen are even beginning to be aware that they must be more than "millmen." Beautifully-working iron stamp mills and quicksilver tubs will fill the bill only partially, in silver reduction especially—a proposition demanding now no proof. Hence chlorination, and sodium amalgam, and smelting, are receiving attention, and are being brought into practice; frequently to the benefit of enthusiastic experimenters, but more in the acquirement of a knowledge of practical metallurgical chemistry and of wisdom, than otherwise; which, after all, may be worth more as an attainment in life than the gold and silver which we seek for so laboriously instead, and do not always find. Thus thousands of experiments are made that result in the general good, though too frequently to the loss of "the company." Without touching upon the question of how this dear experience can be best got round, or obtained most economically, we will mention a thing or two about two new allied metallurgical processes which have some interest in connection with gold and silver extraction, and which seem to hang in suspense—probably frozen fast in the rejected crucibles of more than one experimenter who does not fully comprehend the nature of his failure. We allude to the zinc process of Mr. d'Heureuse, of this city, and the lead process of Mr. Fuller, of Chicago, both of which are patented, yet, so far as heard from, lying idle on the patentees' hands.

The powerful affinity of zinc and lead for gold and silver are ancient facts, that became known to smelters hundreds of years ago, for it was by smelting alone that all those metals were formerly extracted; and they occur together, more or less, all over the world. Full advantage is taken of the relative affinities of these metals in all the great smelting works of England and Germany, as well as out of these countries, where such establishments are little more than copies in the main.

The Pattinson process, which is based on the earlier crystallization and different specific gravity of poor silver lead from rich silver lead, so that the former may be skimmed off, had for its result the profitable remuneration of whole mining districts that had lain unworked for scores of years because the ores could not be made to pay—a brilliant example of the immense value and power of a little unthought-of principle.

The Parkes process makes use of a similar characteristic in the alloy of zinc with silver and lead. The resulting alloys are afterwards separated by cupellation and liquation, or sublimation.

The new processes of d'Heureuse and Fuller differ from all previous applications of the affinities of zinc and lead, in proposing to melt nothing but the zinc and lead respectively, requiring only a moderate heat, while the ores are left in their original condition, and are simply passed through the bath of melted metal by mechanical means. Were the heat increased to the smelting point of the ores, silicates would be formed, of a lighter specific gravity, and the process would not differ from ordinary smelting; but for that purpose proper furnaces and expensive blasts would be necessary. The advantages claimed by both the patentees are the cheapness of the simple pot or kettle required, and the perfect taking out, by the zinc or lead, of all the gold and silver in the ores that can be shown to exist by means of fire assay. So far as these claims are concerned, they are probably not very far wrong. But there are theoretical difficulties, if not practical ones, that have to be encountered, and which will appear obvious to the metallurgist. The sulphur introduced with the sulphurets in the lead process must necessarily combine with the metallic lead, and make a matt of sulphide of lead, which, being of a lighter specific gravity than the lead itself, will float in the form of a stratum on top. We shall have all the phenomena of cupola smelting, excepting only the third stratum, consisting of silicates. Chemically expressed, the pyrites, FeS^2, + Ph, will assume the forms of FeS + PhS.

In the zinc process, the result will be the same, with the additional aggravation of a greater liability to oxidation of the zinc. Whether the oxides and sulphides so formed would be measurably free from silver, or what amount of reducing, and matt desulphurizing, would have to be done in the daily operation of a process of working any given ore, are questions of economy, to be solved only by practical experiment and by the richness and refractory character of the ore by ordinary processes. Possibly the addition of iron might be made use of economically to precipitate the lead from its combination with sulphur in the matt.

We have watched the course of so many distressed, emaciated and forlorn dyspetics, of worn-out and prostrated females, who have taken a new lease of life, and gradually received vigor, strength, health and the power of social pleasure from the effects of PLANTATION BITTERS, that we are not surprised at the testimonials daily received. If it is a pleasure to do good in the world, how full must be the measure of the proprietors of these celebrated Bitters. *

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instant-
ly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 539 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

HUNGERFORD'S
Improved Concentrators.

The above very SUPERIOR MACHINE,

WITHOUT DOUBT THE BEST IN USE,

Is now, since the retirement from business of Messrs. Goss & Lambard, of Sacramento,

MADE EXCLUSIVELY

by the undersigned, at the

PACIFIC IRON WORKS,

Where the concentrators may be seen.

GODDARD & CO.

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.
☞ FIRE AND MARINE INSURANCE. 10v14t9pqr

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

SAFETY FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.

REMOVAL.

THE
MINING AND SCIENTIFIC PRESS
(Patent Agency, Newspaper and Job Printing Office)
Will be REMOVED this day from No. 505 Clay street to
No. 414 Clay Street, below Sansome,
About one-half block east of our former location.
August 8th, 1868. DEWEY & CO.

A Book for Every Miner and Scientific Man.

JUST PUBLISHED,
KUSTEL'S NEW WORK,
CONCENTRATION
Of all kinds of Ores, and the
CHLORINATION PROCESS,
For Gold-Bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally.

Price, - - - - - $7.50

A liberal discount to the Trade. For sale by the Booksellers. Sent to any part of the United States, postage paid, on receipt of the price. Address,

DEWEY & CO., Publishers,
Office of the Mining and Scientific Press, 414 Clay street,
16v1tf SAN FRANCISCO.

Removal and Partnership.

Notice is hereby given, that I have removed from my old stand on Beale street, and have formed a co-partnership with Mr. A. CAMERON, for the purpose of carrying on the business of Stair-Building, Wood Turning and Scroll Sawing. The business will be conducted as formerly at Cameron's, corner of Market and Beale streets, and also at Nos 485 and 487 Brannan street, where ample steam power and all necessary facilities have been provided for every branch of the business.

Different sizes of Redwood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.
15v17-3m N. P. LANOLAND.

QUARTZ MILL WANTED.

Any person knowing of a good second-hand Quartz Mill and Engine—about five stamps—will please address, with price, "A. B. C., care of Mining Press, San Francisco." The Mill is wanted for Mariposa County. Estimates for a new five-stamp Mill and Engine of suitable capacity solicited. 13v17-2w

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Knox's Amalgamators,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either GOLD OR SILVER ORES, and s the only Amalgamator that has stood the test of seven years' continuat working.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st, between Fremont and Beale, San Francisco.
Flue or Tubular **Boilers**, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.
Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.
Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.
To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.
Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care
To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

HYDROSTATIC WORKS.
SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.
M. D. LASSWELL,
No. 747 Mission Street, bet. Third and Fourth.
House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.
I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country. I have now on hand thirteen Pumps in brass and iron, all of my own make.
I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom. Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.
☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair.
☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

IRA P. RANKIN. A. F. BRAYTON. A. C. AUSTIN.
Pacific Iron Works.
First and Fremont Streets,
SAN FRANCISCO.
Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.
Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured
Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.
Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

ASCENT OF MOUNT BAKER.—A correspondent of the Olympia (Washington Territory) *Transcript*, gives an account of the recent successful ascent of Mount Baker. He says:

The Mount Baker expedition has returned after an absence of fifteen days, having met with complete success. The party consisted of E. T. Coleman, Thomas Stratton, Inspector of customs, John Tennent, of Whatcom County, and David Ogilvy, of Victoria. They found two peaks, one hidden by the other. As there is scarcely an appreciable difference in their hight, these were named after Generals Grant and Sherman, respectively, the Grant peak being the one seen from the west or Victoria side. The stars and stripes were planted on both with appropriate national songs, given by Mr. Stratton, and joined in on the chorus by the party. Two rocky peaks of lofty hight, abutting on the mountain, were named after Abraham Lincoln and Schuyler Colfax. The party made a collection of minerals and plants, and have, it is believed, discovered some species which will be found to be new to science. Among others they observed the true Scottish heather and blue bell, which were previously discovered by John Bennett, of Whatcom, on the occasion of Mr. Coleman's first attempt in 1866, and since pronounced, though known in Canada and Carriboo, to be the first discovered in the United States. Mr. Stratton, whose knowledge of geology and long experience of gold mining in the mountain districts of California entitles his opinion to respect, noticed three extinct craters, specimens from which have been obtained. Mr. Stratton is also of the opinion that sandstone or the coal measures is the principal formation in the section of the country explored by the party, and that there is not any gold on this side of the Cascade range. The mountain was approached by the Lummi or Nootsac, which flows into Bellingham Bay, eight miles from the coal mine, then by the middle fork of the river to its base. From this point to the snow line the ascent is very steep and fatiguing, and occupied three days, being through a country covered with dense brush and destitute of any trail or elk track. The mountain is surrounded with glaciers, of which five large ones were counted besides several smaller ones—second or rudimentary glaciers as they are termed by Prof. James Forbes. The great crevasses or chasms in the neve or upper snow fields, were found to be more firmly bridged over than they were on Mr. Coleman's first attempt, and offered a comparatively easy passage to the travelers, at the same time they did not neglect the usual precautions of attaching themselves with a coil of rope, carrying ice axes, alpine poles, and of wearing crampons or creepers, etc. The hight was estimated at 11,571 feet, with an Aneroid barometer, which, however, is never reliable at considerable altitudes.

A FRENCH doctor has discovered that much of the ordinary claret is made of a solution of alum.

The Risdon Iron & Locomotive Works.
Incorporated, April 30, 1868. Capital, $1,000,000.

PHILOSOPHY IN THE FOOT HILLS.—The following ideas, from a miner in a quiet and sunny ravine in El Dorado County, who, we are ready to vouch, is an honest man, as well as a philosopher and a poet, will be found eminently just, and suggestive:

After inveighing against the bad policy of miners running in debt and then lying idle with the expectation of selling out "for a big thing," he continues: Now is the time to look to your interest in all kinds of business; now is the time to stop talking about negros and mongrels, or Chinmen bein pnt in office; if you will Just take notice of some of our fellowmen and see how degraded they are, no wonder the people in California is Coming allarmed on account of the black race. Why, half the population of all the mining towns that I have lived in are saloon-keepers and Idle harpers on politics, and gamblers with their hie heels boots, stuck up on some post as high allmost as he stands, and with a good havana at the expense of some working man, some good man swindled out of his caruings. In my opinion these towns have got to be sifted of so much Idleness. I do not approve of one man doing moore than he is able; any man that is aman, can work eight hours. Many a poor Californian, broken down in health and bad luck, now at this day lays in some lone cabin, paralyzed, in the depbth of sorrow, old age coming on, and they seem to think they aro as young as ever. Only think, all you that came here in forty-nine, twenty years aded to thirty, and have not laid up $50 a year. Why MR. EDITORS its Enough to paralyze any industrious man to walk along these old deserted streams that has been so rich, and see men look so poor and degraded, in some old smoky cabin, and cobwebs and old burbon whisky bottles; now and then medicines for rumatism or paralyzed invalides; and these beautiful streams,—healthy trout streams,—oh just look you hoo have been here since forty-nine. No wonder my nabors often say I'm in meelancholy love. What are the company now of these mon? nothing but long tail, sultry looking Chinamen, or the buffalow head indians, with as much hare on his head as a black Canadian pony's mane or tail, and these flat Chinaman's voices which sounds like tame geese eating corn Early of a cold and frosty morn, with now and then a squeaking blue Jay which breaks the mealancholy reveri of all the day.

THE FATE OF JAPANESE TRAVELERS.—Bitter enmity is still manifested towards all Japanese who have traveled abroad, by their countrymen at home. Kisabro, who visited the United States with Mr. Van Reed, a few years since, is said to be only saved from immolation by wearing the American uniform, as he is entitled to do as an attaché of the American Embassy. Even the titled nobles who came out here as Commissioners to purchase war vessels, and returned home with the ram "Stonewall," fared no better; in fact they were worse off than the others, as they, being "Tycoon's men," labor under an additional disadvantage, especially in the south of Japan. Since their return to Yokohama, they have been keeping close under American protection, Satsuma, the present commander in that quarter, being determined, it is said, to make them each a head shorter if he can get his hands on them. Finding their condition worse than that of State prisoners condemned to the galleys, and that there was no hope of a speedy return of peace to their country, they finally determined to return to America and remain for a time, at least, in a land of freedom and personal safety. They accordingly returned by the Great Republic, and are now stopping in San Francisco.

MR. WINANS, the American contractor of the Petersburg Moscow Railway, is doing some service to legal science. He has had the whole "Corpus Juris" of Russin, (the "Swod Sakonow") translated into English, having employed thirty-eight men in his office for more than a month; his object being to sustain his contract with the Russian Government. The translation is to be published in London.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half inch) bore; and .451 (or small) bore.
These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.
They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.
Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.
Makers of BOXER CARTRIDGES, .459 bore for Revolving Pistols, in use in Her Majesty's Navy.
PIN CARTRIDGES for Lefancheux Revolvers of 12 M, 9 M. and 7 M, bore.

21v12 F. E. WEYGANT, Proprietor.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

CUTTING WOOD ON GOVERNMENT LAND. Several days since a man named Murray was convicted in the U. S. District Court of cutting timber on lands reserved by the Government of the United States, in a place known as New York Cañon, El Dorado County. The defendant was brought into Court for the purpose of hearing its judgment, but several respectable men of El Dorado County had interested themselves in behalf of Murray, on account of his family, which consists of a wife and five children, and Judge Hoffman stated that the sentence would be suspended, but assured Murray that if he repeated the offense the penalty would be imposed.

THE POWDER COMPANIES propose to make some experiments next week in rock blasting, as an offset to the Hafenegger and Giant powder trials. Lime Point will probably be the locality selected.

PORTABLE

Printing Press,

You Can do Your Own Printing at a Trifling Expense.

It is the best, cheapest, and simplest Press ever invented. Gives perfect satisfaction to all who purchase, and is pronounced by all a perfect success. We have sold many of them to Postmasters, Printers, Druggists, Clergymen, and all classes of business men, and they are making and saving money by using them at their homes and places of business.

Price of Presses, $8, $12, $16, $23, $30. Price of Offices, $15, $70, $30, $42, $48, $70. Send for Circular to LOWE PRESS COMPANY, 3 Water street, Boston. 4v17tf

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again What a saving to farmers. No more stooping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash-boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-clocks; a small, inexpensive stationary key is alone required at each station By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16-6m

Our Patent Agency.

THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

Summary of the Geology and Mining of California and Nevada.

NOTES OF A MINING ENGINEER.

J. S. Phillips, M. E., of this city, has written several interestiag letters to the New York *Gas Light and Mining Journal*, descriptive of the geological, mineralogical and topographical features of this coast,—California, and more especially Nevada,—where he has made extended observations in connection with his profes'onal duties in the interest of various mining and metallurgical enterprises. He says:

The coast line is a mountainous chain, which, from general contour and appearance, is more or less volcanic for its whole length; its crowding cones, dark striated streaks of lava, drifts of debris, abrupt contortioas and shaded gulches, contrasting with the diversity of colorings from the various igueous, primitive, trausition, and secondary rocks. Tho mighty chain of mountains (extending from Cape Horn to the most northern shore of North America) passes from view as we cross the gulf, and make the peniusula of Lower California, which commences what is called the upper coast range, the former being denominated, where it parallels the Californias, the Sierra Nevada mountains. Between these two raages, au elongated basin of the various secoadary strata (of several hundred miles in length by 100 miles in breadth) has been uplifted from the ocean's hed, so unoqually and at such irregular periods, that labyrinths of river beds and volcanic dykes, with transition and secoadary coutortions, are found at various levels, strangely intermingled with the fossils and petrifactions of past ages. This region is now drained by the Colorado, Sacramento, St. Joachin rivers and their tributarics.

Conforming to the history and analogy of mining elsewhere, we fiad the gold fields and profitable quartz ledges *near the junction of the primitive with the secondary strata;* on the western corrugated declivities of the granitic transition and secondary foot hills and ravines of the Sierra range, which is mostly composed of various granitic rocks, and forms the western margin of the extinct volcanic region, that extends (with slight exceptions) for some 500 miles across the Nevada State.

Passing over the Sierra Nevada Mountain, the famous Comstock ledge is situated (some 6,000 feet ahove tho ocean,) on its eastern slope, which is hero composed of syenite, graaulite, and feldspathic rocks, and which dip under the ledge eastward; over the ledge a broad irregnlar belt of semi-decomposed feldspar fronts the more prodnctive sections thercof, and forms a rapid transition to the igneous rocks that prevail for several hundred miles east of this range to the Rocky Mountains. This region is elevated about 4,500 feet ahove the sea, and some twenty ranges of mountains arise therefrom iu northerly trendings, and remarkably regular corrugations, from 20 to 30 miles asunder, and from 4,000 to 6,000 feet above these alkaline flats.

The Humboldt Mountain is situated near the center of a very large county of this name; the highest point of its profile is called Star Peak, which is, in common with its general upper crust, composed of blue limestone, that has been upheaved by an extensive and powerful volcauic dyke, to the elevation of 11,500 feet above the level of the sea. This dyke, protruding from its eastern side aud running for upwards of twenty miles, has uplifted and produced the various modified formations found to exist of carbonate of lime, clay slate, granulite, syenite, feldsite, quartzite, porphyry, trap, aad lava. Staading on Star Peak as a center, a fine summer's day unfolds a most extensive and instructive radial view of 160 miles westward to the Sierra Nevada, south to Arizona, east to the Austin Mountain, and north to the pinnacles of Idaho; beiag an area of 90,000 miles, that is inhabited by four Indian tribes. This view is as conspicuous as many sea views of but 30 miles; and the landscapo terminated from the rotundity of the earth more than from the haze of atmosphere. It is peculiar for the rugged, disjointed contour of its enormous amount of irregularly washed naked rock on the mountains, which trend north and south, like so many very elongated, equi-distant, pyramidal islands in the ocean; the sand flats being all of about the same level and alkaline appearance, whereon the sage and grease hush grow, alone, in the wilderness.

It is indeed a strange land; its climate is mild and pure; its aborigines are wild and fierce; however rich its bold perspective, the mincral prospects are poor; though the mountains expose thousands of square miles of bedrock, but few ledges are fonnd to reward the prospectors of this vast cemetery; where in the gradnal uprisings from the ocean's muddy bed, fish, animals and forests grew and petrified; now meandering rivers sink through the volcanic chasms and *debris* of past ages. A perfect combination of panoramic, geological illustrations, showing the diversified and progressively provisional intention of the great Creator through the past. In journeying from this Humboldt Mountain southeasterly, the first range (which I have crossed in eleven places) is composed of similar elcme its to the former, with greater ratios of porphyry, lava and feldspathic mixtures.

The second, third, fourth and fifth ranges are almost entirely composed of porphyritic and other feldspathic varieties, with rare and small patches of ungenerous clay slate and carbonate of lime, upriseu from the flats, in which no ledges of great value have been discovered.

The sixth range, constitnting what has been denominated the Toyabe or Austin Mountain, and the Reese River district, is more primitive in structure, being of the various granites, gneiss, granulite and syenite, with occasional volcanic dykes, and patches of secondaries. This appears to be the only *extensive miningfield* with sufficiently interesting inducements for capitalists that I have seen between tho Sierra Nevada and the Rocky Mountains.

Travelling S. S. E. ahout 90 miles, and crossing over the seventh range, which is mostly composed of porphyritic formations, the district of Philadelphia, or the "Silver Bend," is situated and uplifted from the flat, as small foot hills of clay slate, in a lap of the porphyritic mountain, and over a very strong quartzose reef, that extends for a considerable distance. In this small district of clay slate, which dips about 50° easterly, the Highhridge ledge has been discovered, dipping with the stratum, and is being worked by several companies in extension. This ledge was developed some 60 feet deep at the time I visited Belmont City, averaging in the shaft, open cut, and under drift, four feet in width, and showed indications for profitable mining.

The eighth, ninth, tenth, eleventh twelfth and thirteenth ranges are even more igneous than those described, and possess little of the concomitants of superlatively rich mining fields. On the slopes of the eleventh and twelfth, in upraisings of ungenerous lime stratum, are the districts of Hot Creek (Rattlesnake Cañon) and Reveille, where rich irregular pockets of silver ores have hut infatuated the inexperienced, and injured the real legitimate mining of quartz ledges hy companies possessed with the necessary funds for realization on the large scale.

In mining, transverse tunnels have been too much driven, and often through very hard bedrock, where they might have been driven on the ledge with half the money and with tenfold satisfaction. Shafting on a ledge has hecn disregarded, and mines have been unrealized for want of deeper exploration.

The greatest mistake of the investor in the mines of this district, has been to expect profits at the surface, instead of working some *three or four* ledges that appear to be worthy of *speculative* sinking to a sufficient depth, to reach the more mineralized portion of their sections, where reasonable prohahilities would favor success.

In conclusion, I mnst say that,as a whole the *discoveries* of the Nevada State have beeu painted far too rosily, as too mauy are painfully aware, and the total balance shows. My impression is that much valuahle mineral lies in *unseen* ledges helow the foothills of the mountains, under the sand debris that cover the *secondary flats* between the mountains, and *near their junction* therewith; but this will be for the more systematic perseverance of future generations; in the meantime the State of Califoruia, containing such vast areas of uplifted clay slates, exposes the largest and richest mining field yet discovered in the world.

POPULATION OF SAN FRANCISCO.—The *Bulletin*, editorially, estimates the present population of San Francisco at 153,300. The increasc by immigration siace the end of 1867, is put down at 10,806, aud by births at 3,100—the latter being offset by 2,323 deaths.

THE large amount of land lying hetweeu San José and San Francisco, on the line of the railroad, which by order of the Commissioner of the General Land Office was recently restored to entry under the preëmption laws, has already been taken up hy speculators, who stood ready to cover it with school land warrants.

COAL IN NAPA.—Traces of coal have been found in Napa Valley, ahont 2½ miles from St. Helena, and near White Sulphur Springs, at a place called Pine Cross. So far, only a hundred pounds or so of the outcroppings have beea gathered, but it is said to burn well. The sample shown us is a bright coal, almost in the condition of dust, and sometimes adhering to shale.

NEWS has been received from the German Arctic expedition, under the date of the 20th of June. Greenland has just been sighted, and the crew were in good health.

New Mining Advertisements.

Bunker Hill Quartz Mining Company. Location of Works: Near Amador, Amador County, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the nineteenth day of May, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Weber, C M	33	50	100 00

And in accordanee with law, and an order of the Board of Trustees, made on the tenth day of September, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by R. R. Rollins, auctioneer, at salesroom No. 522 Markel street, San Francisco, Califo rnia, on Monday, the twenty-sixth day of October, 1868, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. A. COOLIDGE, Secretary.

Office, Room 40 Merchants' Exchange Building, California street, San Francisco, Cal. oc10

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of October, 1868, an assessment (No 26) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 25 Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the tenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 25 Merchants' Exchange, south side of California street, between Montgomery and Sansome streets, San Francisco, California. oc10

Washington Mining Company.—Location of Works: Nevada County, California.

The regular Annual Meeting of this Company, will be held on SATURDAY, THE THIRD DAY OF NOVEMBER, 1868, at one o'clock P. M., at the office of the Company, No. 318 Front street, San Francisco.

JOHN J. SCHEELER, Secretary.

San Francisco, Oct. 10, 1868. oc10

Mining Notices--Continued.

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the seventeenth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No Certificate.	No. shares.	Amount.
E C McComb	51	25	$25 00
P C Lander	48	75	75 00
P C Lander	50	150	150 00

Martinez, Ladislao	30	4	120 00
Wingard, A	22, 50, 53	16	480 00

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of August, 1868 so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the twenty-first day of September, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T B WINGARD, Secretary.

Office, 408 California street, San Francisco. sep5

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, the twenty-first day of October, 1868, at the same hour and place. By order of the Board of Trustees.

sep19 T. B. WINGARD, Secretary.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address NEWEY & CO., Mining and Scientific Press office, San Francisco.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

Machinery.

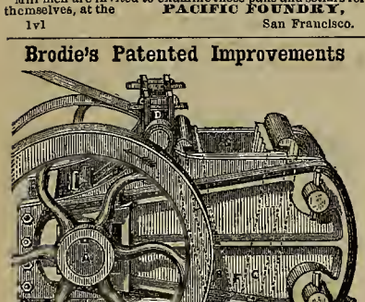
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so completely and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlars for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... $600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump. Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

2v16 **E. O. HUNT, Proprietor.**

STOCK TRANSFER JOURNALS,

STOCK LEDGERS,

ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the *Mining and Scientific Press.*

New Potato Digger.

Parties interested in saving considerable time and money by using the

PACIFIC

POTATO DIGGER AND SACKER,

Should not delay the present opportunity of having one in time for the late Potato crop this season.

☞ Liberal terms to Farmers' clubs ordering more than one. This arrangement secures to members in rotation the great benefit of a machine, and materially reduces their outlay. A Potato Digger of this kind is sufficiently strong for general ranch purposes, and will dig, clean and separate, according to sizes, and sack six to seven acres of potatoes daily, besides the important saving of so much time, and at less than half the cost of the present expensive and dilatory method by hand.

It would require one man from forty to fifty days to accomplish the same amount of work.

A WORKING MODEL may be seen from 11 to 12 and from 1 till 6 o'clock daily, in operation until the 10th of October, at Risdon's Machine Works, corner of Beale and Howard streets, San Francisco.

Fashionable Clothiers

OF

San Francisco.

SPECIALTIES.

PRICE AND GUARANTEE.

The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Bags and Valises, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of piece goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.

STYLES.

Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.

GOODS MADE TO ORDER.

For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc. made to order at short notice.

COUNTRY ORDERS.

Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

Our wholesale House, 623 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest, assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non illuminating flame and light on a wick as easy as a lamp. 21v16-3m

Exposition of the Mineral Land Law.

AN INCORPORATED COMPANY TO BE DEEMED AN ARTIFICIAL PERSON—MAY FILE CLAIM AND RECEIVE PATENT—PROOF OF CITIZENSHIP REQUIRED.

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE, Sept. 1, 1868.

Register and Receiver U. S. Land Office, San Francisco, Cal.—GENTLEMEN.—In a letter of the 27th July last, Senators Conness, Stewart and Nye, called the attention of this office to a question that had been raised in regard to citizenship under the Mining Act of July 26, 1866, when application is made by corporations organized under State or Territorial laws.

It is an invariable principle in the preëmption and homestead laws of the United States, to limit the privileges conferred by said acts, to citizens or persons having declared their intention to become citizens; and the same policy is indicated in the 1st section of the Mining Act. The limitation to citizenship is not repeated in the 2d section, but would appear to be necessarily implied; for as the first section legalized only the occupancy of citizens and such persons as have declared their intentions, etc., and as occupancy must precede an application under the second section, it would seem to follow that if the occupancy of the applicant is not such as has been legalized by the statute it could have no standing in any proceedings under the Act. A proper rule of interpretation would seem to require us to consider the several sections together, and the whole as declaratory of one uniform and consistent policy. The principle of considering together all statutes in *pari materia* would warrant an examination of the rule established by Congress in other enactments for the disposal of the public domain, with a view of ascertaining the intention of the law-making power, when, in any one particular statute, it may not be clearly expressed. It would therefore be entirely too narrow a construction to hold that because the restriction was not repeated in the second section, the uniform policy of the Government for many years was intended to be set aside in the cases provided for in that section.

The foregoing remarks apply to applicants themselves in the character of individuals. In such cases the general principle must be adhered to, and proof of citizens must be furnished. This is the only class of applicants that can avail themselves of the benefits of the preëmption and homestead laws, corporations, as such, not being included in the class provided for in these acts.

But as corporations at the date of the mining act, and for a long time previously, had occupied and improved mining claims according to the local customs and rules of mines, and the right to apply for a patent, is by the terms of this act, extended to any person or *association of persons,* it would be unreasonable to suppose that they were intended to be excluded from the benefits of the law. To exclude corporations would be to deny the privileges of the act to all the most valuable and most extensive mining claims, and would entirely disappoint the expectations of the friends of the bill on its becoming a law. It is evident, therefore, that these bodies must be permitted to share in the benefits of the enactment.

But a corporation is "an artificial being, invisible, intangible, and existing only in contemplation of law. Being the mere creature of law it possesses only those properties which the charter of its creation confers upon it, either expressly or as incidental to its very existence." It can neither exercise the duties of citizenship, become naturalized or file a declaration of intention to become a citizen. The relations of citizenship or alienage cannot, therefore, properly speaking, be said to belong to a corporation at all. To look beyond the mere artificial entity, to the stockholders composing it, and require the citizenship of each one of a large number, scattered frequently through several States and Territories, to be established by proof in applications under the mining act, would involve such an amount of inconvenience and delay as practically to debar corporations from the privilege of making application at all.

The Supreme Court of the United States in giving effect to the Constitutional provisions allowing *citizens* of the State where the suit is brought, to be sued in the Circuit Courts of the United States, by *citizens* of another State, after a variety of decisions, has at last, in the case of the Louisville Railroad Company *vs.* Letson, 2 *Howard,* 555, decided a corporation, created by the laws of a State, performing its functions under the authority of that State and only suable there, though it may have members

out of that State, to be a *person*, though an artificial one, *inhabiting* and *belonging* to that State, and entitled for the purpose of suing and being sued, to be deemed a *citizen* of the State; and it is believed that an equally liberal construction should be adopted in reference to applications for mining patents, by corporations.

It is true that the question in these cases before the Supreme Court pertained to State citizenship, and that the question of alienage was not involved; but when the Court ceased to look beyond the mere artificial being to the natural persons composing it, it is doubtful whether the existence of aliens among the stockholders would produce any change in the rule that the Court has ultimately adopted. At all events the necessities of the mining law would seem to require that the rule should be carried to that extent in proceedings under it, and that every corporation created by the laws of a State or Territory, and legally competent to transact business as such corporation, and to acquire and hold real estate, in such State or Territory, in all applications for mining patents, made within such State or Territory, should be treated and considered as a citizen.

In this class of cases, therefore, you will require evidence of incorporation by the laws of the State or Territory in which the application is made. The usual proof of this is a certified copy of this charter or certificate of incorporation, under the signature and seal of the proper officer, and when this is furnished, proof of citizenship of the stockholders will be dispensed with.

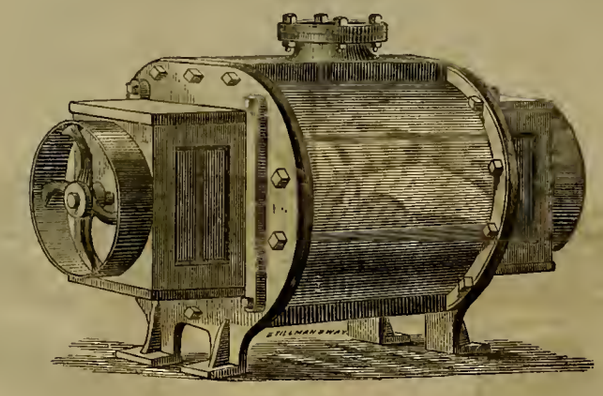
Complaints have been made to this office of exorbitant charges made for filing affidavits to establish the mineral character of certain lands. No authority exists for this. The Act of 21 March, 1864, allows you 22½ cents per 100 words, for the testimony you may reduce to writing in preëmption and homestead cases, but no provision is made anywhere for charging any fee for the mere filing of an affidavit. As high as $1 and sometimes more, it is stated, has been charged for filing each affidavit. Such charges are entirely unauthorized. These affidavits are not in the nature of declaratory statements or home applications; they are merely for the purpose of furnishing the Land Department necessary information in reference to the character of the public lands, so that the proper action may be taken—that mineral lands may not be disposed of as agricultural, or *vice versa*. They are as much a matter of importance to the office as to the parties filing them; and the law authorizes no fee, unless the matter results in an examination or trial between conflicting claimants. These affidavits are useful also in testing the selections made by railroad companies, and preventing mineral lands from being selected; and you will carefully examine them before certifying to such tests.

Another point upon which it is deemed proper to advise you refere to the character of witnesses. The third section of the Act of Congress, approved July 2, 1864, removes the incompetency of a witness on the ground of being a party to or interested in the issue tried, in any Court of the United States; and you will be governed by the same rule in all trials held before and in taking *ex parte* affidavits.

The interest a witness may have in the subject matter of the suit, or to which the testimony pertains, is no longer an objection to his competency, but may, of course, be taken into consideration in deciding upon the weight of such evidence. Very respectfully, your obedient servant,

Jos. S. Wilson, Commissioner.

Chicago Iron Company in Wyoming. The Cheyenne *Leader* says the works of the Chicago Iron Company, which are nearly completed, will afford Wyoming an opportunity of cheaply and practically testing both the coal and the iron of that Territory. The iron to be used in those works will probably be of Lake Superior ore, but there is no coal in Illinois which can be used in smelting it. The coal is said to be of the best quality for smelting such ores, and a car load or two could be shipped to Chicago probably very low, as the Union Pacific Railroad Company would be interested in the experiment as well as others. The company expects to commence operations by the 15th of October, and think they can manufacture iron at from $5 to $7 per ton cheaper than it can be obtained from Pittsburg. The furnaces will be started with Pittsburg coke, and after they are under way they will experiment with the coal of other localities.



It costs $10,650 to collect $402 of taxes in the Beaufort District, S. C.

Velocipedes are used to draw baby carriages in Paris.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco

Important to Californians.—Many inventors have ately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Two Rocks, Sonoma Co., Cal., Sept. 23, 1868.—Messrs. Dewey & Co:—On my arrival home, I found my Letters Patent all arranged to my entire satisfaction. Please accept my thanks for the energy, skill and dispatch with which you procured it for me. In future, should I require assistance in your line of business, I shall most certainly apply to you. Truly yours,

Michael Laufenburge.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tm

NOTICE.

On and after this date, all parties on the Pacific coast manufacturing, using, or selling

Dunbar's Patent Piston Packing,

must obtain a License for the same from the undersigned or they will be subject to the penalties of the law.

H. S. SMITH,
Ætna Iron Works.

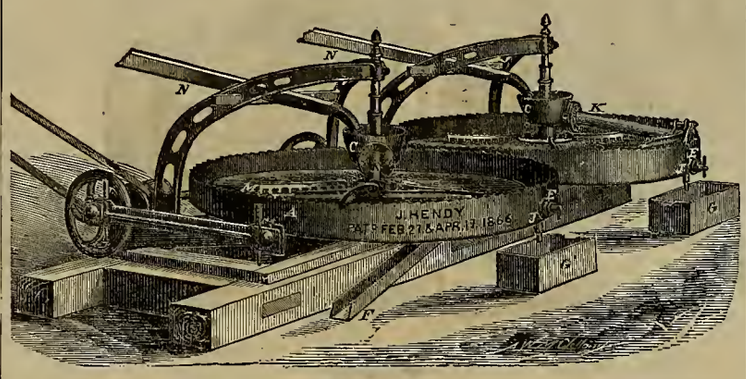
San Francisco, August 15th, 1868. 7v17-3m

Construction of the Mineral Land Law.

The passage in 1866 of what is known as the National Mineral Land Law, marks an era in the history of American mining, which is destined to terminate with the amendatory act that will undoubtedly pass the next Congress, extending unequivocally the provisions of the act for the sale of vein mines, so as to cover all permanent mines of whatever character, in accordance with the recent liberal constructions placed upon the same by the Commissioner of the Land Office, Legislation has advanced very cautiously on this subject, as was proper. Since nothing but good seems likely to result from the granting of fee simple titles to mining land, and as the very extensive gravel mining interests of this State were found to be universally favorable to the granting of titles for placer claims likewise, Mr. Wilson has availed himself of the indefinite signification amongst miners of the terms "vein" and "lode," to construe the law in accordance with the preferences of the class for whose benefit it was framed. Whether or not it was the intention of the authors of the act to embrace deep placer claims,—and there can be no doubt such was not their openly declared intention,—it cannot be denied that the varying nature of mineral deposits, between veins, fissures, fahlbands, stockwerks, (ore deposits in bunches and chimneys), and horizontal strata like the deposits of coal and frequently of iron, etc., which are undoubtedly intended to be included, left the door open, under the wording of the act, for the inclusion of other horizontal deposits, so long as they could be construed to come within the miner's signification of "vein" or "lode." The geological signification of these words happens to be a very different, and a very definite thing; but it does not seem certain by any means that the framers intended to use the word in its strict geological sense, for then they would have excluded coal, and most manganese, iron, and zinc mines, etc. In short, the Land Commissioner found himself left in a muddle under the act, the moment that he was called upon to distinguish between different kinds of deposits; and he has merely attempted to extricate himself by means of a liberal construction of the law.

The word "rock" geologically does not necessarily signify hard rock, but any kind of earthy deposit whatever, for there is no means of drawing the line of distinction; though it seems evident enough that the framers intended nothing but hard rock. But the words specifying "quartz, or other rock in place bearing gold, silver, cinnabar or copper," etc., could be construed to apply to the hard pyritiferous cement of many of the Nevada gravel claims, where the cement is frequently harder than the granite on which it lies, (as at San Juan,) without any undue stretch of the ordinary sense of the term.

We understand it to be the opinion of the U. S. Surveyor-General, the Hon. Sherman Day,—himself a miniug engineer and expert in regard to the use of mining and geological terms—that the act will legally and strictly apply to all deposits that are inclosed within walls or casings of sterile material, whether lying horizontal or standiug vertical, and that can be definitely located and distinctly traced in any particular direction. This would include the ancient river beds, or deep placers.



Miners may prefer not to bother about getting titles from the Government until it becomes a certainty that the officers of the Government possess the right to grant them. But as no one is opposed to Mr. Wilson's free construction of the Mineral Land Law, and as nobody would be likely to contest any title obtained under the present decision except Mr. Wilson's successors in the Land Office, there appears to be little in the way that should necessarily deter the owners of ancient river claims from obtaining Government titles if they desire them.

PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

To J. HENDY.

A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

PATENT AGENCY.

DEWEY & CO.,

SOLICITORS OF

American and Foreign Patents,

414 Clay st., bet. Battery and Sansome,

SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-Issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

Consultation, by mail or otherwise, strictly confidential. Advice free.

There are many rejected applications lying dormant in the Patent Office at Washington from inventors on the Pacific Coast, for which, with able management, patents could be secured that would prove profitable to the inventors and a benefit to the public. Such cases we have taken up with good results, and are willing to make our fees for conducting them conditional on success.

Circulars containing information for inventors sent free.

The inventors of the Pacific Coast, of all others, should be careful to patronize only well known RESPONSIBLE agents.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street, below Sansome, San Francisco.

A First Class Agent

Is wanted by the proprietors of the Mining and Scientific Press. Good wages secured. DEWEY & CO., Publishers and Patent Agents, 414 Clay street.

Offices to Let,

At 414 Clay street, and two rooms on Washington street. Enquire of DEWEY & CO., 414 Clay street.

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE, At the lowest Market Prices.

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent payable in gold.

A profit of at least twenty-five per cent to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first class dealers in the United States and British Provinces.

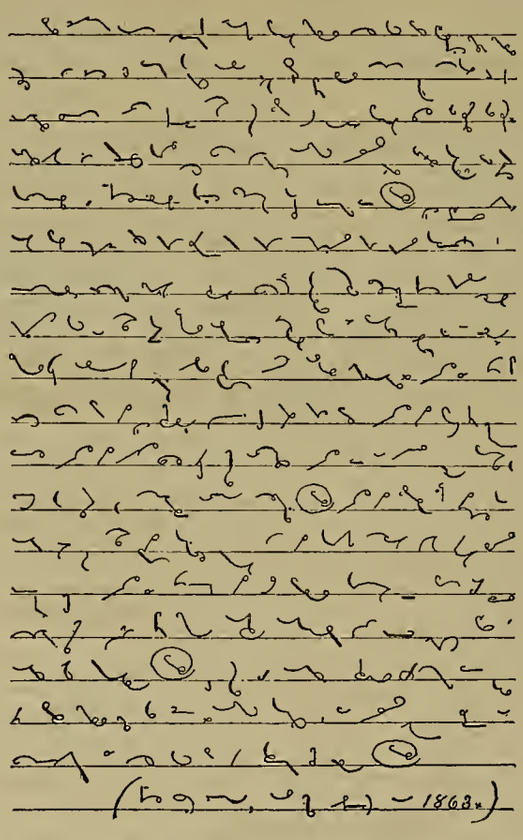
Mechanical Miscellany—Propulsion of Ships; Economical Manufacture of Iron; Tungsten Steel; English Standard Weights and Measures; Steel—the siemens-Martin Process.
Scientific Miscellany—Fossil Plants—Darwinism; Ancient Traces of Man; Combustion under Pressure; A Meteorite from Georgia; Atom Mechanics Again.
Mining Summary—Comprising late intelligence from the various counties and districts in California, Arizona, Colorado, Dacotah, Idaho, Montana, Nevada, N. Mexico, Oregon.
Notices to Correspondents.
New Incorporations.
San Francisco Mining Shareholders' Directory.
New Patents and Inventions.
San Francisco Market Rates.
Stock Prices—Bid and Asked.



Advances in Phonetic Short-hand.

How many there are who, at some stage or other in life, have devoted themselves enthusiastically to the acquisition of that most natural and self-evident of all desiderata, the art of writing phonetic short-hand. Thought being the distinction of man above his fellow subjects in creation, we cannot but be reminded that it is very much like steam and electricity,—comparatively powerless, or only locally operative, until it is caught, and controlled for the accomplishment of a particular end. The history of writing, as it has advanced with the history of civilization, is one of the most interesting of subjects, especially when treated by an able lecturer, who can save one the mystification and abstruseness which are often encountered in the books. Short-hand has been presenting itself in the light of a desideratum to philosophers from ancient times, again and again; and dabblers in short-hand may console themselves with the reflection that they are all natural philosophers. In English, German, and French alike, stenographic systems have now been discarded, and phonographic ones substituted as the only kind of short-hand founded on scientific principles; but in no language or system have the natural sounds of the human voice been so much regarded as in Pitman Phonography, which is now the system universally used in reporting verbal proceedings.

We are glad to be able to chronicle a real step in advance, in the writing of phonetic short-hand. Great revolutions come gradually—continents do not rise above the ocean at a single swoop. Though Pitman's system was very meritorious, and very systematic, and beautiful, so that every bright boy looking over its pages would be seized with a desire to learn it, yet his dreams of a phonographic Utopia, when everybody would be writing "fly-tracks," were premature, and could not be expected to be realized. Two elements were wanting: ease of acquiring it so as to be able to follow a speaker, and legibility. Nothing but years of practice can make a reliable reporter, and a want of the opportunity or the inducement to benefit by such practice, furnishes the reason why so many old students of phonography have little left of short-hand but a few phonographic crotchets floating through the brain.

A number of Americans have labored enthusiastically to improve Pitman's system by methodizing and abbreviating it. Graham and Munson have published voluminuous works. They are destined to be superseded, we think, by the closer method, clearer analysis, more thorough canvassing, and laborious practical trial of all the possibilities of geometry, and of all conceivable combinations of the English language, which are displayed in Marsh's Manual of Phonetic Short-hand; the last pages of which have just been struck off at Eastman's, for Bancroft & Co., the publishers. "Who is Marsh?" asked one of Pelton's schoolboys of another, in the hearing of a friend. "Marsh is the great reporter," was the reply.

CALIFORNIA

Andrew J. Marsh is so well known in newspaper circles in New York and Washington, in California and Nevada, and in the legal fraternity of this State, as to need no further introduction. Our duty is to furnish some account of what he has done for the advancement of phonetic short-hand.

The accompanying plate, with the printed key below, will give an idea of the style, brevity and comparative features of Marsh's reporting, as taught in this book. Those who are in any degree acquainted with short-hand, will observe that Mr. Marsh has done away with a mass of unsystematic, complex, and contradictory material taught in most of the systems heretofore in use; such as the turning over of the f and v to write fr and vr, the initial w hook, the heavy nr and mr, the arbitrary h, in place of which he makes use of the old style mp, the dot word signs, etc. For an old phonographer it will be found quite a satisfaction to look through Marsh's book,—to see how every rule works as inevitably and unexceptionally as the law; so that nothing once learned will have to be unlearned. The number of ingenious and handy things for reportorial use, which Mr. Marsh has systematized, will disclose quite a mine, even to Eastern and English short-hand writers, who will little expect to see anything of this kind emanating from California. Amongst the principal advantages of Marsh's system, may be mentioned that it can be learned in less time, that it can be written more briefly and rapidly, and that when written it is more unmistakably legible than any other system. To which it is important to add, that though it differs in detail from Pitman, Graham, and Munson, there is nothing in it which, if adapted in whole or in part, would clash with any of them, except the words "were" and "are," written with the upward and downward r's respectively.

To contribute materially toward the development of a perfect system of writing is a modest labor which is by no means calculated to incite torchlight processions and nightly serenades in honor of the author; but none can fail to see what a profound influence upon the world a few centuries hence, the simplification and universalization of short-hand may exercise. To those who are interested in short-hand, or in any degree informed on the subject, the claim of Marsh's book to superiority over every other system will speak for itself.

[KEY TO PLATE.]

CALIFORNIA.—Suppose we were called upon to name on all the globe, to-day, the community of four hundred thousand persons most favorably placed, so far as domain, and prosperity, and prospects are concerned. Let a man turn the globe with compasses in his hand, and hold them suspended, and deliberate as long as he may, I defy him to fix the point at any other place than Sacramento—right here at Agricultural Hall—so that the sweep shall include the four hundred thousand souls within the jurisdiction of this Society. What other portion of the earth, held by one organization of less than half a million, will compare, in privilege, resources and hopes, with the portion of this young, beloved Benjamin of American States, whose autumn sack is now stuffed with grain, while the mouth of it contains a cup of gold? [Applause.] A line on the Atlantic coast, representing the length of our State, would run from Boston below Chesapeake Bay, below Cape Hatteras, below the batteries of Gilmore on Cummings Point, to the harbor of Port Royal. And nearly the whole of the area, with this vast water front, is one symmetrical domain, by reason of the mountains that uprear their five hundred miles of jagged whiteness in its back ground; the rivers that flow from the northward and the southward, fed from those snowy springs, to unite in the center of the State; and the bay that receives their volume, rivaling in its conformation the Bay of Naples. Where else has the Almighty delivered to half a million of people such a line of eternal snow, looking down upon such opulent plains? Where else such a fellowship of temperate and tropic climates? Where else such rainless summers, which turn drouths into harvests? Where else gold in the rocks, and, bending over the mills that crush them, peaches that mock the apples of gold in the garden of Hesperides? [Applause.] Where else such sweeps of wheat, such armies of noble cattle on a thousand hills, such bloom of vineyards, and, beneath all, such variety of mineral wealth, which only centuries to come can tap and drain? Where else has the Almighty connected such social blessings with material good—freedom, intelligence, schools, multiplying churches, and loyalty—deliberate-principled, unconditional, invincible loyalty to the Government, and the policy, the freest, the noblest, the worthiest beneath the sun? [Applause.] I do not say this, gentlemen, in boasting. It is only the honest generalization of the map of California, and of the facts which your exhibition presents to our eyes this week. In privilege of position, and in regard to resources, and the future, the State of California, in the American Republic, is the most favored spot which this globe turns to the sun. [Applause.]—*Thomas Starr King, in his address before the State Agricultural Society, in* 1863.

LOOK TO YOUR EYES.—If you will see C. Muller, 205 Montgomery street, you will doubtless be able to see better. *

[Written for the Mining and Scientific Press.]

Mining in Sierra County.

THE ALASKA QUARTZ MINE.

This quartz ledge, promising to become one of the richest gold mines on the Pacific Coast, is situated in Texas Ravine, six miles east of Camptouville, and runs from north-east to southwest along the north side of a raviue. It stands almost perpendicular, and is from four to six feet wide, in talcose slate, with very regular clay seams between the walls and ledge, affording very easy working vein matter. Until now it has been worked without blasting, not cropping out anywhere, but being covered with surface dirt, and having a reddish looking quartz; showing a considerable amount of suphurets, galena, and in some places native copper. In the richest places, there is much free gold, sometimes combined with small particles of native copper. So far as the ledge is worked, three chimneys of rich pay ore about 200 feet apart from each other, have become known. This ledge was first discovered in 1857 hy surface mining. The Texas Ravine paid very rich all the way up, and the gold taken out hy washing off the ground, paid over $100,000, being all quartz gold. As the miners came to the upper part of the ravine this ledge was discovered, and the pay of surface ground gave out as soon as the upper part of the ravine was reached. A camp was formed in 1858, and work was started on this ledge by sinking a shaft and building a mill of eight stamps. The company then took out about $20,000; but insufficient mill arrangements, discontent amongst the shareholders and other disturbances,—more common in former times than now,—broke up the company and caused the work to be stopped. Thus the property remained until last year, when a new company was formed under the management of Mr. McKean, of Camptonville, and finally this year work was again commenced in earnest hy starting a new shaft lower down from the former work. A new chimney of pay ore was struck, a prospecting mill of five stamps with steam engine of 15-horse power, was erected, for milling, hoisting and pumping. This was done under the able management of Mr. Phillip Clerkin, an old friend of miue, who is still employed as engineer at the works. The company sunk a shaft on the ledge to the depth of 146 feet, run drift on the ledge to southwest 90 feet, and to northwest 40 feet, and opened on the southwest drift stopes, now about 45 feet high, leaving a strong pillar on the side of the shaft. The quartz all the way down in the shaft was rich, hut in the southwest drift and the stopes it is exceedingly rich. I saw the books of the company, and can guarantee for the correctness of the following figures: The quartz from the upper part of the ledge paid $12 per ton, and coming lower down the quartz yielded $30, $55, $65, and $200 per ton. The books show that until now 316 tons of quartz were crushed, giving an average pay of $42.70 per ton. The company has not a dollar of indebtedness, and ahout $10,000 in the treasury. The quartz between the pay chimney and the old shaft towards the northeast, contains a pay of about $15 per ton. The northeast drift will in about 100 feet more reach the next pay chimney, and driftiug is followed up day and night. The quartz all through the miue is so soft that the work is done without blasting. Four miners supply the mill with quartz, hut it is only run in daytime. The ledge carries very little water. This ledge is undoubtedly a true fissure, and no pocket vein, as the gold is found all through the mine. As I was examining the mine, a letter was received from the assay office of Rhine & Hemme, San Francisco, giviug the results of an aasay of the sulphurets of the mine as $20.53 in silver and $226.02 in gold; =$246.55 per ton. The mill has no arrangements for the saving and working of sulphurets. The mining and mill expenses average about $1,000 per month. The facilities for water and wood are unlimited, and a good wagon road leads to the mine, hranching off from the Our House on the stage road between San Juan and Forest City. I am indebted to the kindness of the Treasurer of the company, Mr. McKean, and the Superintendent of the minc, Mr. Sterrett, for the opportunity of obtaining the items I desired from the books of the company.

CAMPTONVILLE.

The hydraulic mines will be worked out in the vicinity of this town in about two years; but Camptonville will still be a lively mining camp, as there is undoubtedly a rich belt of quartz veins situated around this place, and up to the Mountain House, about 10 miles from Camptonville. This fact is proved so far hy the rich Alaska quartz mine, and the very rich Brush Creek quartz mine near the Mountain House. Quartz miners' and speculators' attention should he directed to this favorable section of Sierra County, the more as this part of the county is always easily accessible in winter, very little snow falling here, never hindering the stage from running regularly to Marysville.

BROWNS' VALLEY MINES.

I cannot say much about the Brownsville mines, for the following reasons: The only worked mines are the Jefferson, Pennsylvania and Yuha, formerly Rattlesnake mine. The Jefferson is only prospecting, running the mill three days in a week. The Pennsylvania and Yuha are under the management of Mr. E. van Miller, a large owner in both mines, and the writer of the reports in the Marysville *Appeal*. Respectfully,

F. B. S.

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

[Continued from page 226.]

Knowing, therefore, that hut few, even of the metallic elements, possess (at the earth's surface) a density equal to that of either the nucleus or intermediate zone, as shown by such calculations, I infer, therefore, that it requires not only the assumption that hodies do become greatly augmented in density by the application of pressure, but also that there must he a great accumulation of the densest bodies we know (the heavy metals and their compounds) in the interior of the earth, in order to account for the high meau specific gravity of our globe.

The mineral and chemical composition of the original exterior, or crust, of the earth immediately after its solidification must ever he an open question in chemical geology, for neither do we, nor can we, even, expect to meet with any portion of the same in any part of the world, when we reflect upon the great changes it must have experienced during countless ages, and the vast amount of the *debris*, directly or indirectly the result of its wear and tear, which since has been spread over the surface of the globe by mechanical agency.

The conjectures I have ventured to form as to its probahle nature are based upon a study of the mineral and chemical composition of rocks, which, in the present state of geological science, are recognized as being the most ancient on the face of our globe; and as quartz enters into the composition of these as a most promiuent constituent, I, therefore, infer that it had been derived from the *debris* of the original crust.

It is necessary for me now to take into consideration any arguments which have been brought forward in opposition to the conclusion which I have thus arrived at.

In the first place, we have the assertion that the composition of the primitive crust would have excluded free silica. It might as well he advanced that the composition of cast iron would preclude the existence in it of free carhon. A very analagous example, and, therefore, I leave it to the Society to decide whether it is not as correct reasoning to infer by analogy that quartz may have crystallized out of a solution of silica iu highly acid silicates upon a lowering of temperature, as that the graphite in the specimen on the table before us has crystallized out of a solution of carhon in cast iron, upon its temperature heing lowered, which we know to he the fact.

But we have further proof of the contrary than merely reasoning from analogy, for, as is well known, the true volcanic lavas of both hemispheres contain abundance of free silica crystallized as quartz, and the study of the physical structure and crystallization of this quartz furnishes complete p oof that it could not have been mere entangled fragments of quartz, hut that it must necessarily have crystallized out of the melted mass of the rock.

Of late years another argument has been brought forward iu order to prove that rocks containing quartz could not have hecu of igneous origin; and this argument is based upon a study of the specific gravity of silica.

The specific gravity of hexagonally crystallized silica, *i. e.*, the mineral species, quartz, in many cases of undoubted aqueous origin, is found to be 2·6, and the quartz out of many granites is also found to he 2·6.

On the other hand, silica artificially fused before the oxyhydrogen hlowpipe to an amorphous glass, is found to possess a specific gravity of only 2·2.

On these few data the conclusion has been hased, that quartz could not have been formed by igneous agency, hut must invariably have heen au aqueous product.

Now let us examine the value of this evidence of the aqueous formatiou of quartz impartially, for it is a question of vital importauce iu the study of chemical geology.

In the first place, we find that the transparent, vitrified, amorphous product, or glass, produced by the fusion of crystallized or uncrystallized silica, before the oxyhydrogen hlowpipe, is not considered by the mineralogist as quartz at all; for it does not possess either the crystalliue characters, physical properties, or chemical behavior of the mineral species quartz.

The chemist further proves that its chemical reactions are totally different in very important points from those of crystallized silica; and would infer therefrom the probahility of silica heing dimorphous.

Further research informs us that the low specific gravity, chemical reactious, and physical properties of this vitrified product are not alone peculiar to the silica which has been fused before the oxyhydrogen hlowpipe, hut are common to other varieties of silica, hoth natural and artificial, whose origin could not havo heen from igneous fusion, as, for example the silica formed by the decomposition of gaseous compounds of silica or silicon; many varieties of silica from aqueous deposition; the silica of the carapaces of infusoria, etc.: facts which, if not considered as conclusive in totally invalidating, must at least create much douht as to the soundness of a conclusion thus hastily arrived at.

It seemed strange, however, that before so much importance has been attached to an argument so evidently inconclusive, the simple test of its correctness should not have heen resorted to, hy taking the specific gravity of some of the quartz crystals found in true volcanic lavas, where there could be no doubt as to their origin; as I could not discover that this had heen done hy other ohservers, I have done so myself, with the most conclusive results for the specific gravity of quartz crystals broken out of some of the volcanic trachytes of Europe and America, was found to he exactly 2·6, or the same as that of the quartz from granite, or from undoubted sedimentary rocks.

This result would have heen anticipated by the mineralogist, who regards hexagonally crystallized silica as quartz, whether it he of aqueous, igneous, or gasolytic origin.

Having thus treated at some length of the chemical reactions, which I have supposed had characterized what might he termed the cosmogenetic era in the history of our globe, a few words will now he devoted to the consideration of the physical structure and configuration of the earth at this epoch.

I assume that the cooling of the molten sphere ultimately resulted in the production of a globe in major part solid, yet containing in its interior a vast reservoir or reservoirs of still fluid igneous matter, which are still supposed to exist, although it is believed that the amount and character of their molten contents has varied considerahly from period to period in the earth's history.

This heing the case, it is quite immaterial to my views whether it is imagined that the earth commenced solidifyiug first at the center, or at the surface; I am inclined to the opinion, however, that even if the earth, as is considered probable, owing to the influence of pressure, actually did commence solidifying at the center, that ou the other hand, long hefore this solidificatiou had reached the exterior, a crust had also commenced forming at the exterior towards the center, owing to the effects of cooling, and that there thus might he at the same moment a solid nucleus and crust, separated from one another by still, liquid, igneous matter.

It has been advanced, however, that such a crust could not form, since it would be heavier than the molten matter from which it had congealed, and thoreforo would sink down into it.

It is admitted that silicates, when solid and cold, are slightly denser than when molten; hut as this crust would he formed in all parts simultaneously, by a cooling action, taking place uniformly on all sides, it would he a hollow sphere, capable fully of sustaining itself, since its particles would mutually support one another.

The results of experiments upon some bodies which contract iu cooling prove that the effect of heat in many, if not in all cases, was first to expand the previously cold substance more and more, up to about its point of fusion, when it again contracted in the act of becoming liquid, showing that although the cold substance really was heavier than when molten, that on the contrary the same hody expanded hy heat was actually lighter than when molten, and would float on the surface of the molten liquid just like ice upon water.

Applying this deduction, and remembering that the crust of the earth was not formed cold, hut, on the contrary, solidified at a very intense temperature, it becomes easy to explain hoth the probability of its formation and the possihility of its not sinking into the fluid matters helow it.

Upon the complete solidification of this crust over the entire exterior of the earth, it may he supposed that the surface of the sphere would in the first instance present a tolerably even appearance or contour; this uniformity would, however, soon become disturbed by cracks and fissures produced hy the contraction of the mass in cooling still further, and the subsidence of portions of the crust thus broken up may be conjectured to have caused some of the still melted matter below to he protruded upwards into these cracks and fissures, forming dykes iu the original crust.

[To be continued.]

SAFETY FOLDING DOOR FOR SHAFTS.—Daniel Grant, a carpenter at the Belcher mine, Gold Hill, has invented, with a view to insuring the safety of miners working about shafts, a contrivance consisting of folding doors or gates, which stand in front of the compartment, and are so arranged as to close of themselves; so that the doors are always closed except when the cage is in position. When the cage arrives at a station where the safety doors are placed, it presses against a spring ou either side of the shaft, and the doors are instantly opened to their full width, and remain open until the cage moves up or down. Had this simple contrivance heen in use in the Yellow Jacket mine, says the *Territorial Enterprise*, the last fatal accident there would have been prevented, as the unfortunate man could not have got into the shaft without first climhing over the doors. It is equally well adapted for use at the top of the shaft or at stations underground. Safety gates of the kind described above will shortly he put up at the Belcher mine.

AUSTRALIAN MINING STATISTICS.—During the past year there were 470 steam engines employed in Australia in alluvial mining, and 532 in quartz mining. The aggregate power is 20,000-horse, and the rated value ten millions of dollars. The export of gold for 1867 was nearly thirty millions, of which about five-eighths were from alluvial and three-eighths from quartz mines. The rated value of all the gold claims is thirty-seven and a half millions of dollars. The whole amount of gold raised from the first discovery of gold to January 1st, 1868, was six hundred and eighty million of dollars.

The entire gold field extends 350 miles east and west and 180 miles north and south. With regular supplies of water it is urged the gold product would be greatly increased. The government has undertaken to furnish ample water, by means of works on a grand scale, now under contract, and the calculation is that no mining ground shall be without plenty of cheap water at all seasons.

HAIR STRAIGHTENERS.—The Commissioner of Patents has received two applications for patent rights for "hair straighteners." For curling fluids there are many claims, hut what, it was asked, could he the object of uncurling? One preparation is of Iceland moss; the other is nitric acid. The examiners put hoth to the test, and found no uncurling effect. The object of hoth applications appears to be to get the sanction of letters patent in aid to the scheme to sell a worthless article to negroes. The "inventors expect them to buy with a rush a large quantity before the deception would be discovered—supposing that every one would he anxious to unkiuk the peculiar curls that hetray their race.

THE Sitka Ice Company intend to hnild a large ice-house this fall near the foot of Donner Lake. In the spring they intend to erect a commodious hotel near the same place.

WORK on the Yuba railroad hridge at Marysville, is delayed for want of piles.

Mechanical.

The Propulsion of Ships.—*Engineering* publishes a paper upon this subject,—recently read before the British Association by Charles W. Merrifield, F.R.S.,—in which he points out the fact, that in reality we know very little about the laws which govern the resistance offered to the progress of vessels in the water. He says:

"We do not know at the present moment at what rate and in what manner the water which follows an ordinary ship is travelling. Still less do we know the details of what takes place when that following water is taken hold of and driven backwards by a screw propeller, or diverted by a rudder. I do not think it is too much to say that the science of propulsion will henceforth be at a standstill until we shall have learnt this.
